

NEW YORK GEOTHERMAL ENERGY ORGANIZATION

November 25, 2025

Letter of Support Introduction

As a party to the ConEdison rate case (25-E-0072 and 25-G-0073) The New York Geothermal Energy Organization (NY-GEO) has attended the majority of general and breakout sessions in advance of submitting its position of support. We appreciate the opportunity to represent the HVAC installers, geothermal heat pump manufacturers, geothermal drillers, system designers, organized labor, developers, and other professionals comprising our membership who are focused on providing the safest, most reliable and affordable heating and cooling energy to NY businesses and residents. Ground Source Heat Pumps (GSHP's) have been proven to be the most efficient, dispatchable, emissions reduction and peak-time energy shaving technology available. Because of these and other GSHP advantages, including eliminating costly infrastructure and stranded assets, NY-GEO is hopeful that the emphasis on customer affordability will accelerate action toward better solutions in this rate case. The following information summarizes the reasons for our position of support as well as concerns.

Continuation and expansion of SC1-IV, including a price guarantee, is a benefit for customers with GSHP's and is a practical business decision given the positive results from the current rate case data showing customer savings using SC1-IV. Aggressive follow-through by the Company to execute marketing commitments outlined in the joint proposal's Rates Marketing, Education and Outreach Plan will be important to maximizing the value to the company, customers and those who will benefit from a more equitable demand-based rate. Inclusion of an easily accessible page where information on SC1 Rate IV and instructions for signing up, combined with other information on heat pump adoption, including the Clean Heat Program is positive. Also positive is providing proactive rate comparison reports, at a minimum of once per year, to residential customers that have adopted heat pumps both via a company program (and not via a company program if possible).

Rate participation analysis. Thorough analysis and evaluation of the results of this expansion will be important in order to fine tune rate attributes and accelerate customers understanding/acceptance in future years as well as encourage other utilities to consider similar rate structures. The tool's backend will be designed to save historic data on the number of customers enrolled in Rate IV, number of customers that lowered their bills with Rate IV, and average and median savings. For even greater understanding, if possible, NY-GEO feels the existing and proposed SC1-IV report needs to be expanded to include all demand-based rates, including the Rider Z rates, and would be further improved if the report could provide not only the averages (means), but also the medians and the standard deviations. This added data could make it much easier to understand the distribution of the rates' benefits.

Elimination of ratepayer funding for the Differentiated Natural Gas Pilot Program and Gas Methane Capture Project. At a time when reduction of fossil fuel use and affordability are key objectives, NY-GEO agrees no ratepayer funds should be spent on these types of programs that allow fossil fuel combustion.

Electric Advantage and Energy Exchange Programs. NY-GEO is in favor of the flexibility availed to the Company by implementing the Electric Advantage Program and Energy Exchange Program as two separate, annual portfolios, which must pass the Societal Cost Test (SCT) test on a portfolio basis (instead of current implementation whereby each Leak Prone Pipe NPA or Service Line NPA project must individually pass the SCT)

Beneficial Electrification and Transportation Timeline EAM. Including an incentive for the Company to focus on improving electrification connectivity is supported. We feel the proposed targets are reasonable and seem to strike a balance between transportation and building electrification incentives.

Greenhouse Gas Emissions/CLCPA: Reduction of greenhouse gas emissions (and resulting climate disruptions/warming) is the main objective of the CLCPA and subsequent scoping plan. NY-GEO is pleased to see important and meaningful emissions reporting included in this joint proposal.

Leak Prone Pipe Replacement versus Removal/Repair. NY-GEO is disappointed and concerned about insufficient planned reduction of Leak Prone Pipes (LPP's). We support the approach of NRDC which suggests the Gas Infrastructure Replacement or Reduction Program set a goal of meeting 20% of the cumulative target through non-replacement strategies, such as the Electric Advantage Program or another NPA, relining, repairs, or deferral in lower-risk situations until a cost-effective NPA can be implemented. Under the NRDC plan the company would receive a 50% shared savings incentive for NPAs and 30% for other non- deferral alternatives. Affordability and electrification are not just 3-year issues and NY-GEO feels strongly that this rate case is the proper time to more aggressively pursue savings associated with safe non pipeline alternatives incentives. In addition, reduction of long-lasting pipeline assets would reduce the stranded asset costs that will burden future gas customers.

We appreciate the opportunity to participate in this rate case and offer NY-GEO expertise, experience and input throughout the rate case's duration.

Respectfully

John Rath

Director of Operations
New York Geothermal Energy Organization

About NY-GEO: The New York Geothermal Energy Organization (NY-GEO) is a non-profit trade organization representing geothermal heat pum2p (GHP) installers, manufacturers, distributors, drillers, consultants and industry stakeholders from throughout New York State and beyond.
