VII. Gas Cost Volatility Management ……..…….…..… 37

VII. Conclusion ……..…..… 43

I. Introduction and Qualifications

Q. Please identify the members of the Gas Supply Panel.

A. The Gas Supply Panel ("Panel") consists of Elizabeth D. Arangio, Samara Jaffe, and Robert K. Moore.

Q. Ms. Arangio, please state your name and business address.

A. My name is Elizabeth D. Arangio. My business address is 170 Data Drive, Waltham, Massachusetts 02451.

Q. Please describe your business position and responsibilities.

A. I am the Director of Gas Supply Planning with responsibility for the gas supply resource portfolios of National Grid USA's ("National Grid") local gas distribution companies in New York, including The Brooklyn Union Gas Company d/b/a National Grid NY ("KEDNY") and KeySpan Gas East Corporation d/b/a National Grid ("KEDLI") (collectively the "Companies"). In addition to the New York portfolios, I am responsible for planning the gas resource portfolios of National Grid's New England subsidiaries. I also manage National Grid's gas Customer Choice programs.

Q. Have you previously testified before the New York Public Service Commission ("Commission")?

A. Yes. I submitted testimony in the 2016 KEDLI and KEDNY rate cases (Cases 16-G-0058 and 16-G-0059, respectively) (the "2016 KEDNY and KEDLI Rate

Cases"), 2017 Niagara Mohawk rate case (Case 17-G-0239) (the "2017 Niagara Mohawk Rate Case"), the 2019 KEDNY and KEDLI rate cases (Cases 19-G-0309 and 19-G-0310, respectively) (the "2019 KEDNY and KEDLI Rate Cases"), and the 2020 Niagara Mohawk rate case (Case 20-G-0381) (the "2020 Niagara Mohawk Rate Case").

Q. Please summarize your educational background and your professional experience.

A. I graduated from the University of Massachusetts in 1991 with a Bachelor of Business Administration. In 1995, I graduated from Bentley College with a Master of Business Administration. From 1991 to 1994, I worked as a Gas Accounting Analyst in the Marketing Operations Department at Algonquin Gas Transmission Company. In 1994, I joined Boston Gas Company as a Gas Supply Analyst. In 1997, I was promoted to Group Leader Transportation Services, with responsibility for managing all activities associated with the customer choice program. In 1998, I was promoted to Director of Gas Acquisition and Transportation Services and assumed responsibility for the administration of Boston Gas's gas resource portfolio and customer choice program in Massachusetts and, in 2000, the resource portfolio of EnergyNorth Natural Gas, Inc. in New Hampshire. In February 2004, I assumed the additional responsibility for gas supply planning for the Companies' resource portfolios. Following the acquisition of KeySpan Corporation ("KeySpan") by National Grid, I was named to my current position and assumed added responsibility for National Grid's gas resource portfolios in Upstate New

York and Rhode Island. In August 2018, I assumed the added responsibility of managing National Grid's gas Customer Choice programs.

Q. Please state your name and business address.

A. My name is Samara Jaffe. My business address is 100 East Old Country Road, Hicksville, New York 11801.

Q. Ms. Jaffe, please describe your business position and responsibilities.

A. I am the Director of Gas Contracts, Compliance, and Hedging with responsibility for the acquisition of long-term gas supply and pipeline capacity; gas contract management; intervention in proceedings before the Federal Energy Regulatory Commission ("FERC"); compliance with FERC regulations in connection with gas trading activities for National Grid's gas distribution companies in Massachusetts and New York; and oversight of National Grid's hedging program.

Q. Please summarize your educational background and your professional experience.

A. I graduated from the State University of New York at Buffalo in 2006 with a Bachelor of Arts degree in Chemistry. In 2012, I graduated from Touro Law Center with a Juris Doctor. In 2016, I graduated from Dowling Institute with a Master of Business Administration. I joined KeySpan in 2007 as a Natural Gas Scheduler with responsibility for scheduling natural gas on interstate pipelines to meet the requirements of National Grid's wholesale firm gas customers. After graduating

from Touro Law Center in 2012, I accepted the role of Program Manager for my group and was promoted to Director in April of 2021.

Q. Mr. Moore, please state your name and business address.

A. My name is Robert K. Moore. My business address is 100 East Old Country Road, Hicksville, New York 11801.

Q. Please describe your business position and responsibilities.

A. I am a Manager of Gas Supply Planning with responsibility for the gas supply resource portfolios of KEDNY and KEDLI.

Q. Please summarize your educational background and your professional experience.

A. I graduated from Manhattan College in 1991 with a Bachelor of Science in Mechanical Engineering. From 1992 to 2000, I worked for the Long Island Lighting Company (until its merger with KeySpan in 1998) as a Field Engineer and progressing to Senior Engineer. From 2001 to 2005, I worked as a Gas Supply Planner at KeySpan with responsibilities for KEDNY and KEDLI's gas supply portfolios. From 2005 to 2008, I worked as an electric trader at KeySpan responsible for managing the portfolio of assets used to serve electric customers on Long Island as well as the Rockaway Peninsula in Queens. In 2008, I was promoted to Manager of Gas Supply Planning for National Grid's gas resource portfolio in Upstate New York (Niagara Mohawk). In 2012, I assumed my current role as

Manager of Gas Supply Planning responsible for National Grid's Downstate New York gas resource portfolios (KEDNY and KEDLI).

II. Purpose of Testimony

Q. What is the purpose of your testimony?

A. The purpose of the Panel's testimony is to:

(i) Describe the Companies' efforts to purchase gas supply, pipeline transportation, and storage services on a reliable, least-cost basis in the twelve months ended December 31, 2022 ("Historic Test Year"), the twelve months ending March 31, 2025 ("Rate Year"), the twelve months ending March 31, 2026 ("Data Year 1"), the twelve months ending March 31, 2027 ("Data Year 2") and the twelve months ending March 31, 2028 ("Data Year 3;" collectively, Data Years 1, 2, and 3 are referred to as the "Data Years");

(ii) Discuss the Companies' efforts to supplement pipeline capacity with additional indigenous and renewable gas supplies;

(iii) Present the Companies' forecast of gas costs for the Rate Year;

(iv) Describe the results of the marginal cost gas supply studies for the Rate Year;

(v) Discuss the Companies' Gas Cost Volatility Program; and

(vi) Discuss the Companies' Customer Choice Program.

Pursuant to the Commission's "Order Authorizing Combined Gas Portfolios" issued October 28, 2005 in Case 05-G-0903, as of November 2005, the Companies

combined the planning and dispatching of their gas supply portfolios to provide the Companies' customers enhanced reliability of supply and lower costs. Therefore, the Panel's testimony addresses the combined portfolios of the Companies and the material presented is applicable to both KEDNY and KEDLI.

Q. Does the Panel's testimony include any exhibits?

A. Yes. The Panel's testimony includes the following exhibits that were prepared under our supervision and direction:

Exhibit __ (GSP-1)	KEDNY & KEDLI Portfolio Schematics;
Exhibit __ (GSP-2)	KEDNY & KEDLI Pipeline Transportation Contracts;
Exhibit __ (GSP-3)	KEDNY & KEDLI Storage Contracts;
Exhibit __ (GSP-4)	KEDNY/KEDLI Projected Monthly Gas Stored Volumes and Dollars for the Rate Year and Data Years Summarized by Market Area, Gulf Coast and LNG storage;
Exhibit __ (GSP-5)	KEDNY/KEDLI Purchased Gas Expense for the Twelve Months Ending ("TME") December 31, 2022;
Exhibit __ (GSP-6)	KEDNY/KEDLI Forecast of Variable Gas Expense for the TME March 31, 2025, 2026, 2027 and 2028;
Exhibit __ (GSP-7)	KEDNY/KEDLI Forecast of Purchased Gas Expense for the TME March 31, 2025, 2026, 2027 and 2028;
Exhibit __ (GSP-8)	KEDNY & KEDLI Estimated Marginal Commodity Cost of Gas;
Exhibit __ (GSP-9)	KEDNY & KEDLI Estimated Annualized Marginal Capacity Cost of Gas;
Exhibit __ (GSP-10)	KEDNY & KEDLI Non-Migration Capacity Release Revenues; and
Exhibit __ (GSP-11)	KEDNY & KEDLI OSS Transaction Revenues.

III. Gas Supply Portfolio

Q. Please describe the Companies' gas distribution systems.

A. KEDNY's gas distribution system serves Brooklyn, Staten Island, and portions of Queens, all located within New York City. KEDLI's gas distribution system serves a portion of Queens not served by KEDNY, as well as Nassau and Suffolk counties on Long Island. KEDNY and KEDLI are parties to an agreement with Consolidated Edison Company of New York, Inc. ("Con Edison") concerning the ownership and operation of the New York Facilities System ("NYFS"), the high-pressure gas transmission system serving the three downstate New York distribution companies. This agreement permits the parties to contract for the transportation and receipt of gas from various interstate pipelines that interconnect with the NYFS, including Transcontinental Gas Pipeline Company LLC ("Transco"), Texas Eastern Transmission LP ("Texas Eastern"), Iroquois Gas Transmission System LP ("Iroquois"), and Tennessee Gas Pipeline Company, LLC ("Tennessee"). KEDNY and KEDLI contract for service from each of these pipelines as well as various other upstream pipelines and storage service providers.

Q. Please describe the Companies' gas supply planning process.

A. The Companies' planning horizon for supply and capacity purposes is ten years. Typically, in the spring of each year, the Gas Supply Department develops plans to meet the Companies' gas supply requirements for the annual period from November 1 of that year through October 31 of the following year. This planning process begins with an updated, ten-year demand forecast of customers' gas

requirements that ultimately determine incremental pipeline, storage, or peaking needs.

Q. What are the Companies' combined forecast design day requirements for the Rate Year and Data Years?

A. The Companies' design day requirements are as follows:

- Rate Year = 2,926 MDth (thousand dekatherms)/day
- Data Year 1 = 2,961 MDth/day
- Data Year 2 = 2,999 MDth/day
- Data Year 3 = 3,035 MDth/day

Q. What is the basis for the Companies' city gate requirements?

A. The primary firm demand (*i.e.*, core customer load forecast) forms the basis for the Companies' gas supply portfolio. The primary firm demand is the demand from the Companies' firm customers, regardless of whether they purchase gas commodity from the Companies or energy service companies ("ESCOs"). Pipeline and storage capacity, along with peaking assets, are used to satisfy the primary firm demand. An annual load duration curve or similar approach is utilized to structure capacity contracts to best meet the shape and frequency of the anticipated loads and to assure the Companies' ability to meet those loads. At this time, the Companies do not incorporate any reserve margin assumptions when developing their design weather forecasts and capacity requirement determinations.

Q. What contracts or assets are included in the Companies' existing portfolio?

A. Exhibit __ (GSP-1) sets forth schematics of the Companies' gas portfolios and provides the maximum delivery entitlements from various sources of supply, including underground storage contracts.

Q. Please describe Exhibit __ (GSP-2) – Pipeline Transportation Contracts.

A. Exhibit __ (GSP-2) summarizes the firm pipeline transportation capacity and bundled peaking assets in the Companies' gas supply portfolio for the 2022-2023 winter season (November 1, 2022 to March 31, 2023). Listed for each contract is information concerning the service provider (pipeline or supplier), tariff rate schedule, contract volume, and contract expiration date.

Q. Please describe Exhibit __ (GSP-3) – Storage Contracts.

A. Exhibit __ (GSP-3) summarizes the Companies' firm storage contracts and the transportation contracts used to deliver storage withdrawal volumes to the city gate for the 2022-2023 winter season. Listed for each contract is information concerning the storage service provider, tariff rate schedule, contract volume, and contract expiration date.

Q. What are the pricing terms, indices, etc. of the Companies' gas supply contracts?

A. KEDNY and KEDLI use a variety of pricing terms in their supply contracts including fixed, index, basis, and composite. Composite pricing is a combination

of index plus pipeline transportation commodity charges and fuel losses. The table below lists the indices the Companies used in calendar year 2022:

INDEX	LOCATION
Gas Daily	Eastern Gas, North
Gas Daily	Eastern Gas, South
Gas Daily	Iroquois, receipts
Gas Daily	Iroquois, zone 2
Gas Daily	Millennium, East receipts
Gas Daily	Tennessee, zone 4-300 leg

TRANSCO	ZICK	Marcellus

Q. What is the role of underground storage in satisfying customer requirements?

A. Approximately 32 percent of the Companies' normal winter supply obligation and 28 percent of their design day demand requirement are met by deliveries of gas withdrawn from storage. Under the Companies' storage contracts, storage deliverability typically declines as inventory decreases (known as "withdrawal ratchets"). Once reached, these ratchets cannot be reversed until the following year. Therefore, the Companies establish a storage withdrawal plan prior to the winter season to maintain inventories at levels that allow sufficient storage deliverability to meet forecast winter peak conditions (storage rule curve).

Market area storage provides the Companies with services that cannot be easily duplicated with other assets. The most important attribute of storage assets is flexibility, which is vital in serving changing customer requirements. The Companies' Transco storage service contracts provide end-of-day balancing that minimize the risk of over/under run penalties. Whereas typical supply purchases must be dispatched ratably (i.e. at the same volume for each day of a weekend or

holiday), storage allows enhanced flexibility by allowing daily and intraday adjustments to meet changing conditions. In addition, storage improves the load factor of flowing pipeline assets and is critical in meeting design weather conditions. This value cannot be duplicated by replacing storage with Marcellus production. The Companies utilize a least-cost dispatch to fill storage. Where Marcellus shale supplies present an opportunity to displace long-haul supplies for storage refill, the Companies take advantage of the economically priced supply.

The Companies also have approximately 20 billion cubic feet ("Bcf") of Gulf Coast storage capacity. These storage fields are made available to ESCOs as part of the optional Gulf Coast storage release that occurs every April. Assuming no ESCOs opt-in for the Gulf Coast storage release, approximately 4.5 Bcf of the total capacity is reserved for *force majeure* purposes. The remaining 15 Bcf of capacity, usually the entire KEDNY Washington Storage Service ("WSS") field, is utilized for off-system sales ("OSS"). If all ESCOs opt-in, the capacity utilized for OSS would be reduced accordingly. Transco has received approval from FERC to proceed with implementing market-based rates for these Gulf Coast storage fields which may impact the Companies' use of Gulf Coast storage capacity beginning in 2024.

Q. What is the role of liquefied natural gas ("LNG") in the Companies' portfolio?

A. The Companies maintain two on-system LNG facilities in Greenpoint, Brooklyn and Holtsville, Long Island. The Greenpoint LNG facility allows KEDNY to store approximately 1.6 Bcf of gas and currently has peak day vaporization capability of

approximately 291,000 dekatherms (Dth) per day. The Holtsville LNG facility allows KEDLI to store approximately 0.6 Bcf of gas and has vaporization capability of 103,000 Dth/day. Collectively, the Greenpoint and Holtsville LNG facilities provide the Companies with approximately 13 percent of their peak day gas supplies.

LNG provides the Companies with on-system services that cannot be easily duplicated with other assets. Because these resources can be brought online quickly, the LNG plants can be used to meet hourly fluctuations in demand, maintain deliveries to customers, and balance pressures across portions of the distribution system during periods of high demand. Most importantly, these resources are vital in preserving delivery pressures in the event that an off-system resource becomes unavailable.

Q. What is the role of compressed natural gas ("CNG") in the Companies' portfolio?

A. The Companies currently maintain four CNG sites on KEDLI's gas system. The three sites in Nassau County are each capable of injecting up to 17,600 Dth/day, while the fourth site, located in Suffolk County, is capable of 8,800 Dth/day – the Companies are planning to increase the capabilities of this facility to 17,600 Dth/day for the 2024/25 winter. A fifth site is being constructed in Suffolk County with commissioning expected to be completed in the Summer of 2023. The fifth

site will be capable of injecting up to 17,600 Dth/day. The Companies are planning to procure a dedicated CNG supply for the fifth site for the 2025/26 winter.

Q. What changes are planned related to swing services, peak shaving or winter peaking assets, facilities, or operations for the Rate Year through a five-year planning horizon?

A. As further discussed in the direct testimony of the Gas Infrastructure and Operations Panels ("GIOP"), the Companies plan to take the Holtsville LNG facility out of service for critical maintenance repairs in April 2026. There are no other planned changes related to swing services, facilities, or operations through a five-year planning horizon.

Q. What are the projected monthly beginning and ending volumes and dollar balances for gas stored through the end of the Rate Year and Data Years?

A. Exhibit __ (GSP-4) provides the projected monthly volume and cost of injections and withdrawals for the Companies' underground and LNG storage facilities for the Rate Year and Data Years, summarized by market area, Gulf Coast, and LNG storage.

A. <u>Indigenous and Renewable Natural Gas ("RNG")</u>

Q. Do the Companies purchase supply from any local natural gas production?

A. A new bio-gas facility at Newtown Creek was placed into service in March 2023. The Newtown Creek facility is forecast to produce the following estimates of RNG:

FY 2024 – 169,765 Dth

FY 2025 – 196,165 Dth

FY 2026 – 215,782 Dth

FY 2027 – 226,571 Dth

FY 2028 – 237,900 Dth

Q. What steps are the Companies taking to capture the benefits of connecting additional indigenous and RNG gas supplies directly to the distribution systems?

A. The Companies participated in the development of the "NYS Interconnect Guide for RNG" document along with the Gas Technology Institute ("GTI"), Northeast Gas Association ("NGA"), and other gas utilities in New York State. This document outlines the entire interconnect process for RNG projects and contains Engineering Services Agreement and Gas Sales (Interconnect) Agreement templates. These documents serve as base templates to facilitate negotiations with project developers for new RNG projects in the service territories. Negotiations with project developers, and the refinement of RNG interconnection designs, are also incorporating takeaways from KEDNY's development of the Newtown Creek RNG project, where KEDNY partnered with New York City's Department of Environmental Protection ("DEP") to capture biogas generated on site and condition it to pipeline quality gas that is currently being injected into the distribution system.

Additionally, in support of our efforts to advance the clean energy transition and achieve net zero by 2050, National Grid issued a Request for Information ("RFI") on May 13, 2022 to further understand the opportunities available in the market to procure sustainable supplies, including RNG, hydrogen, and other innovative renewable proposals and resources. The RFI was issued to RNG and hydrogen project developers, as well as existing suppliers and capacity providers already known to the Companies, to understand the current market's ability to meet National Grid's demand for lower-carbon fuels. The RFI alerted the market to National Grid's potential gas supply requirements, and also provided insights on the existing portfolio of pipeline infrastructure National Grid expects will be repurposed in coming decades to flow low carbon/fossil free molecules. Further, the RFI specifically alerted respondents that the request to the market would enable National Grid to gather market data to better understand the range of potential solutions for meeting customers' future energy needs, even though National Grid was not seeking formal commitments at the time. Thus, the RFI responses were evaluated for informational purposes only. As a result of the RFI, National Grid became aware of projects across North America that are in various stages of development and continues to learn of new RNG opportunities through subsequent discussions with project developers and producers, as well as potential opportunities to deliver hydrogen into the region.

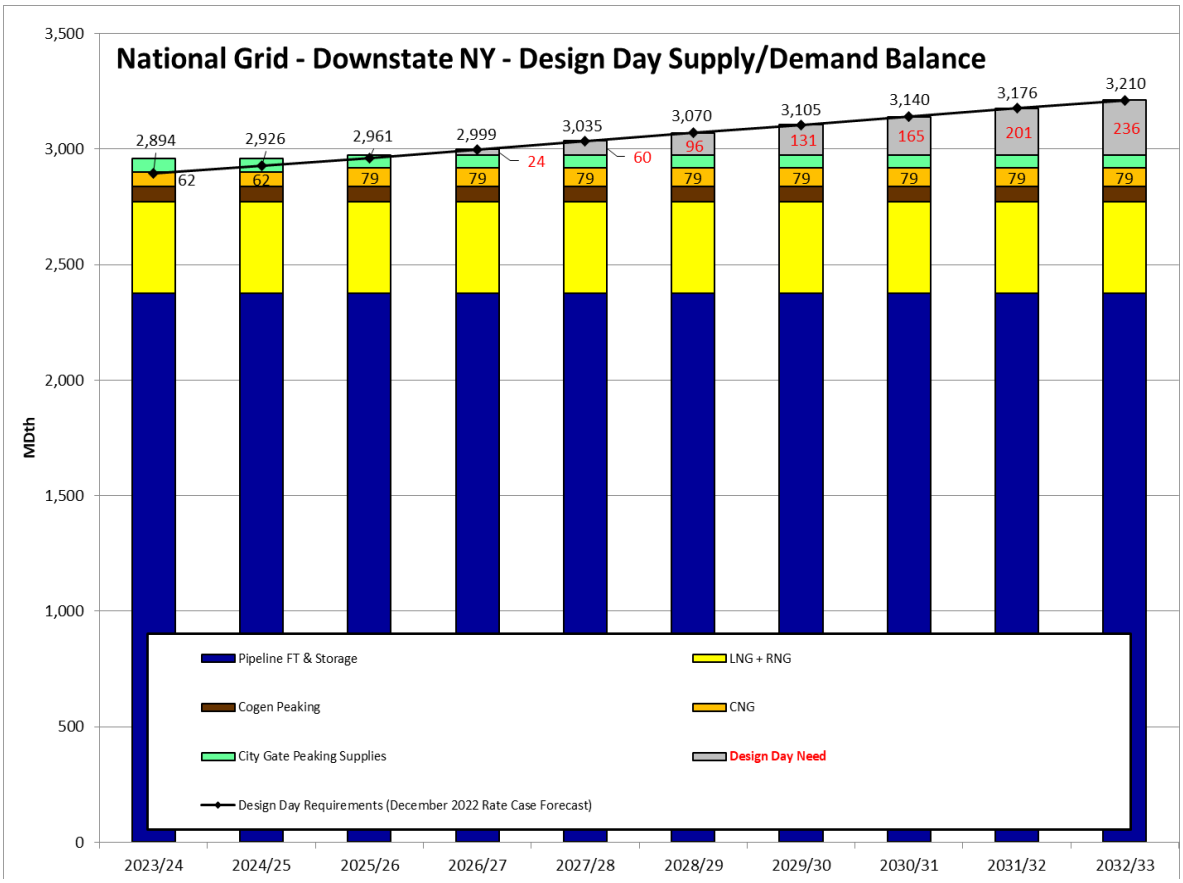

Q. What efforts are the Companies making to identify potential new gas supply sources?

A. Pipeline capacity is an integral component of the Companies' gas supply portfolio to deliver sufficient natural gas to serve our customers. While pipeline capacity cannot be entirely displaced, the Companies continue to explore ways to reduce reliance on pipeline capacity. As discussed in the testimony of the Companies' Gas Infrastructure Operations Panels, the Companies are pursuing various supply initiatives, including on-system renewable gas and hydrogen projects.

B. <u>Enhancement by Compression Project</u>

Q. Do the Companies plan to add any incremental pipeline or storage capacity in the next five years to meet forecast design day load requirements?

A. Yes. Due to continued customer interest in conversions from oil to natural gas for space and water heating, as well as increased demand from existing customers in their service territories, the Companies have continued to experience growth in the demand for natural gas. The Companies' ten-year load forecasts show that demand for gas will continue to grow. KEDNY and KEDLI expect the demand for gas to grow at an annual rate of approximately 1.1 percent and 1.6 percent, respectively, for the next ten years. The graph below shows the balance between the forecast design day demand and the Companies' supply portfolio for the ten-year period ending 2032/33.

In response to forecast growth, KEDNY and KEDLI signed a precedent agreement with Iroquois to deliver an additional 62,500 Dth of natural gas per day to the downstate New York area. Iroquois has received the necessary authorization from FERC and now requires permits from both the New York State Department of Environmental Conservation and the Connecticut Department of Energy & Environmental Protection before the project may commence construction.

IV. Portfolio Management

Q. Please describe the Companies' gas supply planning goals.

A. The Companies' primary gas supply planning goals are to:

(i) Dispatch the gas supply portfolio assets under a least-cost strategy to reliably meet projected primary firm demand;

(ii) Maintain a diverse portfolio of gas supply, storage, and transportation capacity contracts with varying terms and pricing provisions; and

(iii) Implement a formal hedging program to mitigate price volatility.

These goals are consistent with the Commission's "Statement of Policy Regarding Gas Purchasing Practices" issued in Case 97-G-0600 and updated by letter issued March 31, 2011. The Companies maintain a portfolio that meets customer requirements under design conditions while maintaining sufficient flexibility for mild winters.

The Companies monitor these goals with regular meetings (monthly supply plan, quarterly review, and annual RFP review). Pursuant to Recommendation IX-4 from the final audit report in the Commission's 2013 gas management audit (Case 13-G-0009), the Companies established a process for the quarterly review of gas supply procurement plans compared to actual purchases for a sample of days during the quarter. The review identifies variances in volumes and the use of storage and delivery pipelines caused by weather, market conditions, operational constraints, or other factors. Variances are reviewed for patterns and opportunities to improve the procurement process. The Companies' Energy Procurement group has been conducting quarterly reviews since 2015. Reviews are attended by representatives

from Gas Supply Planning, Gas Trading, and Origination and Price Volatility Management.

Q. Please describe the Companies' gas purchasing process.

A. The Companies contract for quantities of gas to ensure sufficient supply to reliably meet design conditions, as well as to account for daily and seasonal load variations. Supply contract durations are generally limited to one year or less. A combination of term and spot contracts provides the necessary flexibility with respect to volume, which allows the Companies to respond to fluctuations in demand. Term contracts have durations of more than one month and, in general, have a specified fixed daily base load quantity. Most of these term contracts have base load quantities necessary to satisfy requirements under a "warm winter" scenario and may include some summer storage refill quantities. Other term contracts provide call options to buy bundled gas supplies delivered either to the Companies' city gates or to other upstream supply points.

The Companies also utilize no-notice storage to manage variations in load, which provide the ability to automatically withdraw or inject gas at the end of the day to balance system load.

Spot purchases of gas supplies for a term of one month or less are made throughout the year to supplement term supplies to meet system demand, manage demand variations, and maintain planned storage inventory targets. North American Energy

Standards Board ("NAESB") form standard contracts have been established with several qualified and reliable gas suppliers, which spreads acquisition and performance risk among many counterparties, thus improving reliability. Soliciting bids from multiple counterparties also affords more competitive pricing.

The Companies plan to flow, within their available firm pipeline transportation capacity, gas supplies purchased under firm contractual arrangements with varying degrees of swing flexibility depending on time of year, pipeline, and system operations.

The Companies leave capacity available each day to allow for purchases in the daily spot market to accommodate changes in system sendout driven by weather and to allow for diversity of pricing (*i.e.*, daily index vs. monthly index). The amount of capacity available depends on the time of year and storage availability. In the winter, the Companies will look to storage as the primary swing supply, although it cannot account for all possible conditions. Leaving some transportation capacity unencumbered allows flexibility to meet changing conditions. Decisions depend on demand, weather, storage inventory level, pipeline operating conditions and price.

During shoulder months, when storage may not be fully available, the need for day-ahead purchases becomes more acute. During the summer, there is sufficient available capacity to accommodate day-ahead swings.

Q. What is the current level of natural gas supply used by the Companies to meet normal customer requirements, and how will that amount change in the Rate Year?

A. Of the 285 Bcf of forecast normal customer requirements for November 2022 to October 2023, the Companies are required to purchase approximately 205 Bcf. The remainder will be procured by ESCOs. For the Rate Year, forecast normal customer requirements are approximately 287 Bcf, with 210 Bcf served by the Companies and the remainder by ESCOs.

Q. How do the Companies evaluate expiring contracts for gas supply?

A. As decision dates for contract extension/termination approach, the Companies determine the need to maintain and or modify (to the extent possible) each contract as part of the resource portfolio. The Companies use several criteria to assess the need for transportation and storage contracts including, but not limited to, receipt point liquidity, reliability, complement to the existing portfolio, and economics.

Also, the Companies consider options to replace long-haul capacity with shorter-haul capacities. For example, as supplies from the Marcellus shale region became abundant and readily accessible, the Companies did not renew expiring long-haul contracts with Union, TransCanada, and Empire pipelines that delivered more expensive supplies from Dawn, Canada. The option to reduce capacity paths is not one typically offered by the pipelines, so, when the opportunities occur, the Companies will seek to take full advantage of such de-contracting providing such

options do not have an adverse effect on the reliability and economics of the portfolio. The Companies recently renegotiated the existing transportation agreement with Millennium Pipeline Company LLC that allows access for East Pool pricing into KEDLI's city-gate at South Commack; as part of that negotiation process the Companies did not pursue renewal of an agreement to transport supply from Stagecoach to Corning.

Q. Does the Companies' supply purchasing strategy enable them to benefit from the increased production from the Marcellus and Utica shale regions?

A. Yes. There was a shift in the Companies' actual purchases from the Market Area to the Marcellus region from 2021 to 2022. That trend is expected to continue going forward.

The table below compares purchases for calendar year 2022 to calendar year 2021 for both KEDNY and KEDLI from the specific regions:

Region	2021	2022	Change
Canadian	1,064,388	2,394,159	1,329,771
Gulf Coast	9,370,155	11,991,079	2,620,924
Marcellus	139,317,737	157,948,138	18,630,401
Market Area	49,627,981	41,715,710	(7,912,271)
Total	199,380,261	214,049,086	14,668,825

The Companies do not purchase LNG in the wholesale market, but do purchase CNG for use at the Long Island injection points. The Companies' LNG storage facilities are filled via gas system supply through a liquefaction process.

The table below shows the Companies' actual purchases for calendar year 2022 by type of supply:

Type	KEDNY	KEDLI	Total
Canadian	140,211	2,253,948	2,394,159
Domestic	121,723,856	89,931,071	211,654,927
CNG	0	54,381	54,381
Total	**121,864,067**	**92,239,400**	**214,103,467**

Q. Do the Companies engage in OSS, capacity release, and other arrangements to reduce their total gas costs?

A. Yes. The Companies constantly monitor their gas resource portfolio to ensure that the appropriate mix of pipeline transportation capacity, market area storage, bundled city gate supply, and peaking resources are available to serve projected firm design requirements. To further minimize costs, the Companies seek to optimize portfolio assets when they are not being utilized for the benefit of firm customers. Except for Gulf Coast storage, for the Rate Year and beyond, the Companies have no plans to enter any pre-arranged OSS, capacity release, or streaming arrangements that would encumber upstream assets. As in years past, once the winter heating season begins, the Companies will actively pursue opportunities to sell available supply and/or capacity in a manner that does not diminish overall supply adequacy, reliability, or operational flexibility to firm customers. For example, on warm days in shoulder months when pipeline capacity is not fully utilized, the Companies will seek to sell excess capacity to off-system customers. Under this type of transaction, the Companies will purchase supply and

transport gas on available pipeline capacity and then assess the associated variable costs plus a negotiated margin to the off-system customers. The Companies will also look for opportunities to execute physical pipeline trades where available. Under such trades, the Companies would purchase firm supply delivered to the city gate on one interstate pipeline and sell a like amount of supply to another third party at a higher price on a different interstate pipeline.

The Companies hold approximately 20 Bcf of production area storage that is used to: (i) maintain supply reliability during force majeure supply outages in the Gulf Coast; (ii) balance on-system loads; (iii) support the Companies' Price Volatility Management Program; and (iv) make off-system production area sales. KEDNY and KEDLI used approximately 15.4 Bcf of that capacity for production area OSS for the 2022/23 winter. The amount of Gulf Coast storage capacity released to marketers under the retail access program for 2022/23 was 106,072 Dth. At this time, the Companies do not propose to modify their OSS practices.

Q. Do the Companies enter into asset management agreements ("AMAs") to maximize the value of their supply portfolio and reduce their overall supply costs?

A. Yes. Beginning November 1, 2021, the Companies acquired access to year-round firm transportation capacity through supply AMAs, which will remain in effect for the coming winter. Under a supply AMA, the Companies accept a release of firm transportation capacity from a counterparty/supplier from the transportation path's

primary point of receipt to the primary delivery point of interconnect with the Companies' distribution systems. Within defined nomination and pricing parameters, the counterparty would have the option to put supply to the Companies during the term of the AMA and the Companies could transport these supplies directly to their customers, maintaining control over the firm transportation and nomination activity to the city-gate. Where the counterparty declines to exercise its put option, the Companies can purchase an alternative source of supply for transportation to their customers. In exchange for such right to manage this asset, the Companies would pay to the counterparty/supplier an AMA fee. These supply AMAs are summarized as follows:

Counterparty	Interconnect	MDQ (dth/day)	Path Summary
NJR	Tetco M3	3,500	Release of TETCO FT-1 capacity from Dominion Leidy Storage (M2) for redelivery into M3 at Goethals NY
NJR	Tetco M3	40,000	Release of TETCO FT-1 TME capacity from production area points for redelivery into M3 at Goethals NY
NJR	Transco Z6 NY	5,000	Release of Transco FT capacity from Tetco-Lambertville for redelivery into Z6NY at Long Beach and KEDNY
NJR	Iroquois Z2	40,468	Release of IGTS RTS capacity from Waddington for redelivery into Z2 at South Commack
Morgan Stanley	Transco Z6 NY	78,000	Release of Transco FT capacity from Marc I on Transco's Leidy Line into various points of interconnect with the NYF
Nextera Energy Marketing	TETCO M3	25,000	Release of Tetco TEAM14 capacity having a path from M2 receipt points for redelivery into Goethels NY

In addition to these supply AMAs, for the period beginning November 1, 2022 through and including October 31, 2023, the Companies entered into several AMAs whereby the Companies release their capacity to an asset manager and retain a right to call on the asset manager to deliver gas supplies to the Companies within defined nomination parameters. Outside of meeting its gas supply requirements, the asset manager may optimize the asset for its own account. In exchange for the right to optimize the capacity, the asset manager pays to the Companies an AMA fee. These AMAs for the period of November 1, 2022 through and including October 31, 2023 are summarized below:

LDC	Path	Term	MDQ
KEDNY	AMA – Transco Gulf to Leidy	Nov22-Oct23	10,688
KEDNY	AMA – TGP Northern Storage to Z5 White Plains	Nov22-Oct23	10,000
KEDNY	AMA – Transco Long-Haul Station 65 to Citygate	Nov22-Oct22	55,000
KEDNY	AMA – Transco New York Bay	Nov22-Oct23	50,000
KEDNY	AMA – Transco NEC/Rockaway Lateral	Nov22-Oct23	50,000
KEDNY	AMA – TGP & TETCO - Stagecoach to Goethals	Nov22-Oct23	20,000
KEDNY	AMA – Transco MARC 1 to City-Gate	Nov22-Oct23	19,500
KEDNY	AMA – EGTS New Market & IGTS	Nov22-Oct23	30,000
KEDLI	AMA – Transco Long-Haul Station 65 to Citygate	Nov22-Oct23	45,000
KEDLI	AMA –Transco Long Beach to City-Gate	Nov22-Mar23	10,000
KEDLI	AMA – NE07 – Non-Ratable & Ratable	Nov22-Oct23	80,000
KEDLI	AMA – Dawn to IGTS Z2	Dec22-Oct23	40,468
KEDLI	AMA – Dawn to Waddington	Dec22-Oct23	19,963

For the period beginning November 1, 2023, the Companies have already solicited offers for AMAs and are in the process of negotiating the following transactions:

LDC	Path	Term
KEDNY	AMA – Transco Gulf to Leidy	Nov23-Oct24
KEDLI	AMA – Dawn to Waddington	Nov23-Oct24

In addition to the AMAs that are currently being negotiated for the period beginning November 1, 2023, the Companies are considering issuance of RFPs for those paths currently under held by asset managers. The decision to award such RFPs will be based on a variety of factors, including market valuation for the right to manage the path, as well as operational benefits presented through the use of an AMA.

Q. Do the Companies have existing or previous gas supply arrangements with any affiliated marketing/trading organizations?

A. No.

Q. What are the revenues received over the last five fiscal years (April 2018 – January 2023) from releases to shippers other than on-system customers that have migrated from bundled sales to transportation service?

A. Exhibit __ (GSP-10) summarizes the revenues received from non-migration capacity releases.

Q. What are the revenues received over the last five fiscal years from OSS transactions, WSS transactions, and AMAs?

A. Exhibit __ (GSP-11) summarizes the revenues received from OSS, WSS, AMA transactions from April 2018 through December 2022.

Q. Please describe Exhibit __ (GSP-5) – Purchased Gas Expense.

A. Exhibit __ (GSP-5) shows the Companies' purchased gas expense for the Historic Test Year. This expense includes the purchased cost of gas (less the cost of storage injections plus the cost of storage withdrawals) and all pipeline fixed and variable charges.

Q. Please describe Exhibit __ (GSP-6) – Forecast of Variable Gas Expense TME March 31, 2025, 2026, 2027, and 2028.

A. Exhibit __ (GSP-6) shows the projected commodity prices of the various natural gas supplies that are forecast to be purchased and delivered to the Companies for the Rate Year and the Data Years to serve the estimated requirements of the Companies' firm customers under the assumption of normal weather. This commodity price projection serves as the basis for the forecast of purchased gas expense developed for these periods. A least cost dispatch analysis was performed to determine the mix of flowing supplies and storage withdrawals that would be dispatched to the city gate each month to serve estimated normal firm customer demand.

Q. Please describe Exhibit __ (GSP-7) – Forecast of Purchased Gas Expense TME March 31, 2025, 2026, 2027 and 2028.

A. Exhibit __ (GSP-7) shows a forecast of purchased gas expense for the Rate Year and Data Years. This expense includes the purchased cost of gas (less the cost of

storage injections plus the cost of storage withdrawals) and all pipeline fixed and variable charges.

Q. How do the Companies review and monitor the costs associated with their pipeline capacity?

A. The Companies closely monitor and review all rate and tariff filings submitted to the FERC by the interstate natural gas pipelines with whom the Companies contract for service. The Companies will intervene, and when necessary, actively participate in such proceedings to ensure the Companies continue to pay fair rates and receive just and reasonable service. In interstate pipeline rate proceedings, the Companies often participate with other local distribution companies in a shipper group, which will retain an expert witness to advance commonly held positions. The Companies also regularly engage in settlement discussions with gas pipelines and FERC Staff to settle tariff-related matters without the need for a formal and costly hearing process. More broadly, the Companies monitor all natural gas related activity at FERC to stay abreast of and participate in policy developments that could impact the Companies and their customers. The Companies track FERC orders, attend technical conferences convened by FERC to address major policy issues, and submit comments in response to notices of proposed rulemaking and notices of inquiry issued by FERC on policy matters impacting wholesale gas markets.

V. Marginal Cost Studies

Q. Please describe Exhibit __ (GSP-8) – Estimated Marginal Commodity Cost of Gas For Period: November 1, 2024 through March 31, 2025.

A. Exhibit __ (GSP-8) shows the projected marginal gas commodity costs for the period November 1, 2024 to March 31, 2025. By running two dispatch simulations, the marginal gas supply sources that would be dispatched to serve an incremental increase in customer demand were identified. First, a baseline dispatch on the simulation model was prepared to establish the least-cost mix of gas supplies that would be dispatched to serve firm sales customer demand under normal weather. Then, the simulation model was rerun with an increased customer demand of 1,000 Dth per day over the winter months (November through March) to identify those marginal supplies that would be dispatched to serve the increased demand. The exhibit reflects the average monthly commodity cost of the marginal supplies that were dispatched.

Q. Please describe Exhibit __ (GSP-9) – Estimated Annualized Marginal Capacity Cost of Gas for Period November 1, 2024 through March 31, 2025.

A. Exhibit __ (GSP-9) shows the projected annualized marginal gas capacity cost for the period November 1, 2024 to March 31, 2025. This study incorporates the fixed costs of new capacity that the Companies would acquire for the Rate Year to reliably meet projected design demand growth. Based on this calculation, the annualized marginal capacity cost was determined to be $5.22 per Dth, as set forth on Exhibit __ (GSP-9).

VI. Customer Choice Program

Q. Describe the Companies' Customer Choice Program.

A. The Companies' Customer Choice Program provides customers the option to purchase their supplies from Marketers (also known as ESCOs). There are two service options, Daily and Monthly Balancing. The Companies currently assign to Marketers at maximum rates such interstate pipeline transportation and storage capacity as is necessary to meet migrating firm customers' load. This practice is consistent with the Commission's August 30, 2007 Order in Case 07-G-0299. City gate pipeline and storage capacity contracted for core customers is assigned to Marketers for migrating customers in proportion to the anticipated design day load of the customers. All migrating firm customers are required to participate in the Companies' mandatory assignment program.

Q. What service classes are available to transportation customers?

A. For KEDNY, transportation customers can receive service under Service Classification ("SC") SC-17 Firm and SC-18 Non-Firm Demand Response. For KEDLI, transportation service is available under SC-5 Firm, and SC-19 Non-Firm Demand Response.

Downstate New York Service Classes

a. **KEDNY SC17 Firm Transportation.** Available to any Existing Core Customer that: 1) qualifies for service metered at a single delivery point under the applicable Core Transportation and Swing Service (CTS) rate; and 2) meets the general terms and conditions for service provided for under the corresponding sales SC as contained in this Schedule for Gas Service; and 3) can provide proof of firm gas supply providing clear and marketable

title to gas adequate to meet the Customer's requirements; and 4) has contracted for direct delivery of such supplies to the company.

b. **KEDNY SC18 Non-Firm Demand Response.** Available to any Non-Existing Core Customer that: 1) qualifies for service metered at a single delivery point under the applicable Non-Core Transportation Service (NCTS) rate; and 2) meets the general terms and conditions for service provided for under the corresponding sales SC as contained in this Schedule for Gas Service; and 3) can provide proof of gas supply providing clear and marketable title to gas adequate to meet the Customer's requirements; and 4) has contracted for direct delivery of such supplies to the company. The applicable rates and charges for CTS service are as follows: NCTS-5A, NCTS-6C, NCTS-6G, NCTS-6M. The Company shall have the right to issue Operation Flow Orders (OFOs) in order to maintain system integrity or to ensure Company's continued ability to provide service to its firm customers.

c. **KEDLI SC5 Firm Transportation.** Service is available under this SC for the transportation by the Company of customer-owned natural gas to: (a) a single Customer with a single facility or meter, that can demonstrate annual natural gas consumption of at least 3,500 dth at the single meter; (b) a group of Customers that can demonstrate annual natural gas consumption of at least 5,000 dth; (c) a single entity or firm with facilities at more than one location or having more than one meter that can demonstrate annual natural gas consumption of at least 3,500 dth at a single meter; and (4) a single entity or firm with facilities at more than one location or having more than one meter that can demonstrate annual natural gas consumption of at 5,000 dth.

d. **KEDLI SC19 Non-Firm Demand Response.** All non-residential purposes, including multi-dwelling, that exceed 2,000 dth annually of customers-owned natural gas and for which the customer requires transportation service. Customers will agree to the following: (i) To only use gas delivered by the Company under this Services Classification in the equipment specified in the Non-Firm Demand Response Service Agreement.

Q. How are transportation customer imbalances tracked and reconciled?

A. When an ESCO customer's meter is read, the customer's account transaction is sent from the customer system to the Companies' Gas Transportation Information

System ("GTIS"). GTIS then compares the ESCO's expected deliveries, adjusted for actual weather for the billing period, to the customer's actual usage for that same period. The usage is prorated into the applicable calendar month based on actual degree days. Thereafter, a cash-out index price is applied to the difference between the ESCO's deliveries and customer usage. Cancel and rebill activity will be captured in the month in which the cancel or the rebill occurred as far back as three years. There have been no imbalance penalties assessed to a customer in the last three years.

Q. Were there any problems or issues arising from implementation of the Commission's August 30, 2007 and March 28, 2008 Mandatory Capacity Release Orders (Case 07-G-0299) and FERC Order 712?

A. The Companies have not experienced any issues from implementation of the Commission's Mandatory Release orders. The Companies no longer have any ESCO capacity that is grandfathered to the city gate.

Q. What are the pipelines and allocation percentages being utilized for the mandatory assignment of capacity?

A. The table below provides a list of the pipelines being utilized for mandatory assignment of capacity, and the allocated percentage of each, for Winter 2022-2023.

Pipeline	Allocated %
Transco Long Haul	24.6%
Transco Leidy	9.0%
Transco Leidy Seasonal	2.1%
Transco Rockaway	15.1%
Tetco Long Haul	10.4%
Tetco Leidy Short Haul	4.7%
Eastern Leidy	5.3%
Tennessee - Tetco	2.2%
Tennessee	2.2%
Northeast 07	12.8%
Dawn to Iroquois	10.5%

Q. Do the Companies' true-up any differences between the Companies' weighted average cost of capacity ("WACOC") and the charges paid by marketers and direct customers for released capacity?

A. No. For the 2021/2022 winter season (November 2021 through October 2022), the Companies' WACOC was between $0.9366 and $0.9688 per Dth. There is no true-up or reconciliation process in place to account for any differences in cost.

Q. Are the Companies proposing to make any changes to their Customer Choice Programs?

A. No.

VII. Gas Cost Volatility Management

Q. What steps do the Companies take to mitigate the impact of gas cost volatility on their customers?

A. The Companies mitigate volatility in the gas commodity markets in several ways. First, they maintain a balanced portfolio that includes contract storage. This allows the Companies to inject gas during the summer for withdrawal during the winter, which enables the Companies to mitigate price volatility during the winter when demand is greatest. Second, the Companies maintain a geographically diverse gas supply portfolio that helps to reduce exposure to volatility in any single supply region. Third, the portfolio incorporates pricing diversity that minimizes exposure to volatility at a single pricing point or market index. Finally, the Companies mitigate price volatility with a formal hedging program.

Q. Please describe the Companies' hedging program.

A. The Companies' overall pricing diversity and volatility mitigation plan is to protect prices for approximately 50 percent, but no more than 60 percent, of forecast winter firm sales and to allow prices to float with the market for the remaining forecast winter sales. For this purpose, the "winter period" is defined as November through March. Prices are fixed through a combination of planned storage withdrawals, which provide a natural hedge at the average price of summer period injections, and financial hedging using either NYMEX gas futures contracts or NYMEX Over the Counter ("OTC") financial settled swaps and options using bilateral master agreements.

To determine the quantity to be hedged, the Companies forecast firm sales for each month November through March, assuming normal winter weather conditions, and calculate the storage withdrawals as a percent of firm sales (Step 1); the result is deducted from 50 percent and that difference, when multiplied by firm sales (Step 2) results in the quantity of gas to be financially hedged to achieve the 50 percent target in each month.

Once the volume of gas to be financially hedged each month is known, a monthly hedging plan is created. The purchases are spread evenly over 16 months starting 18 months prior to the start of each November. Each financial transaction is settled against the expiring month's last day settlement price and the applicable Inside FERC "First of the Month" index price. The gross settlement payout or gain is included in the gas cost for that month.

The table below summarizes the percentage of forecast gas supply hedged physically and financially for the January 2022 – December 2022 test year:

Pricing Mechanism	*Downstate NY*
Physical (storage)	26%
Financial (swaps and options)	24%
Index	50%

The table below itemizes the number of financial swap (futures) and option contracts hedged for the Historic Test Year. The units for the data below are in contracts; one contract equals 10,000 Dth.

Hedge	Downstate NY (contracts)
NYMEX Collars	426
NYMEX Calls	635
EGTS SP Collars	1684
EGTS SP Calls	425

Q. Have the Companies' hedging practices changed in the past year?

A. No. The Companies continue to monitor the effectiveness of NYMEX and South Point for all receipt points in the forecast to determine the most appropriate hedging location. Financial options provide superior downside protection versus swaps. As a result, one of the "lessons learned" from previous winters includes favoring up to 100 percent of options for the financial hedge component of the portfolios.

Q. Please explain how the Companies calculate gas price volatility.

A. Gas price volatility is measured as the standard deviation of the lognormal of the ratio of the monthly hedged price change through the winter, November through March. This standard deviation is compared against a similar calculation for the NYMEX and South Point Natural Gas monthly settlement prices for the same November through March period.

Q. Discuss how the Companies determine the success or failure of their gas price mitigation program.

A. The success or failure of the gas price mitigation program is determined by comparing the physical and financial hedged prices with natural gas market price

indices over the same period. The hedge program is expected to show lower month-to-month price volatility than that of the market index.

Q. Please discuss internal reporting, oversight, and the audit structure of the Companies' gas price mitigation program.

A. The Companies review the hedging program and highlight any changes with the Commission on an annual basis. The Companies have a comprehensive internal approval process to authorize a hedge strategy and maintain oversight requirements. The hedging program reporting and oversight is documented in the Companies' U.S. Energy Commodity Risk Management Policy.

Prior to trade execution, a hedging strategy is documented with details that may include risks to be hedged, volumetric targets, duration and cadence of hedge plan transactions, and types of instruments to be used. This documentation is then reviewed and approved by the Commodity Management Committee ("CMC") prior to going to the Companies' Energy Procurement Risk Management Committee ("EPRMC") for approval and authorization. The CMC consists of senior members of accounting, legal, credit, regulatory, marketing services, and risk management departments, and ensures that the strategy meets all internal and external requirements. The EPRMC consists of senior executives within the Companies' and provides ultimate authorization for any hedging activities.

The Companies employ the industry standard best practice of an independent three-

office model. In this model, the front-office develops and executes the strategy; the middle-office confirms and monitors the risk of the deals, as well as compliance with the approved strategy; and the back-office is responsible for invoicing and reporting on the Companies' financial statements. Additionally, the Companies' internal auditing department has performed audits to ensure compliance, for example, with Sarbanes-Oxley.

Q. Please provide the actual price hedging performance versus planned price hedging performance for the Historic Test Year.

A. A comparison of actual price hedging performance versus planned price hedging performance, including separate quantities for each financial hedging instrument, is shown in the tables below:

For The Brooklyn Union Gas Company & KeySpan Gas East Corporation (Historic Test Year):

The Brooklyn Union Gas Company & KeySpan Gas East Corporation	Hedges (dt)	Planned Price ($/dt)	Actual Price ($/dt)
Financial Hedges			
NYMEX Collars	4,260,000	$3.59	$3.82
NYMEX Calls	6,350,000	$2.74	$3.10
EGTS SP (Dom SP) Collars	16,840,000	$3.75	$4.09
EGTS SP (Dom SP) Calls	4,245,000	$2.67	$3.37

Q. What percentage of the Companies' gas supply is physically hedged?

A. As a result of planned storage withdrawals, which are based on normal weather, approximately 30 percent of the forecast November through March firm sales

demand is physically hedged. The Companies do not hedge storage injections. The Companies do not have any physical supply contracts with fixed price terms.

Q. How do the Companies use swaps/futures?

A. OTC swaps/futures are used to execute fixed price hedged transactions. OTC swaps do not have any execution, transaction or commission fees. The Companies rely on credit thresholds in their bilateral master agreements to limit the amount and frequency of margin calls associated with the daily mark-to-market valuation of each hedge transaction. When the mark-to-market with each OTC counterparty exceeds the credit threshold, the Companies use their various credit facilities to meet the cash collateral margin calls.

Q. What types of options do the Companies use?

A. The Companies uses a combination of calls and puts.

Q. Describe how the Companies decide which types of options to use.

A. When the underlying futures price is expected to fall, then call options are preferred over swaps. Collars may be purchased instead to reduce the premiums paid or when the underlying futures prices are expected to be stable.

Q. Do the Companies place a limit on what they spend on options in any year?

A. The Companies cap their option premiums at $13 million per year.

VIII. Conclusion

Q. Does this conclude your testimony?

A. Yes, it does

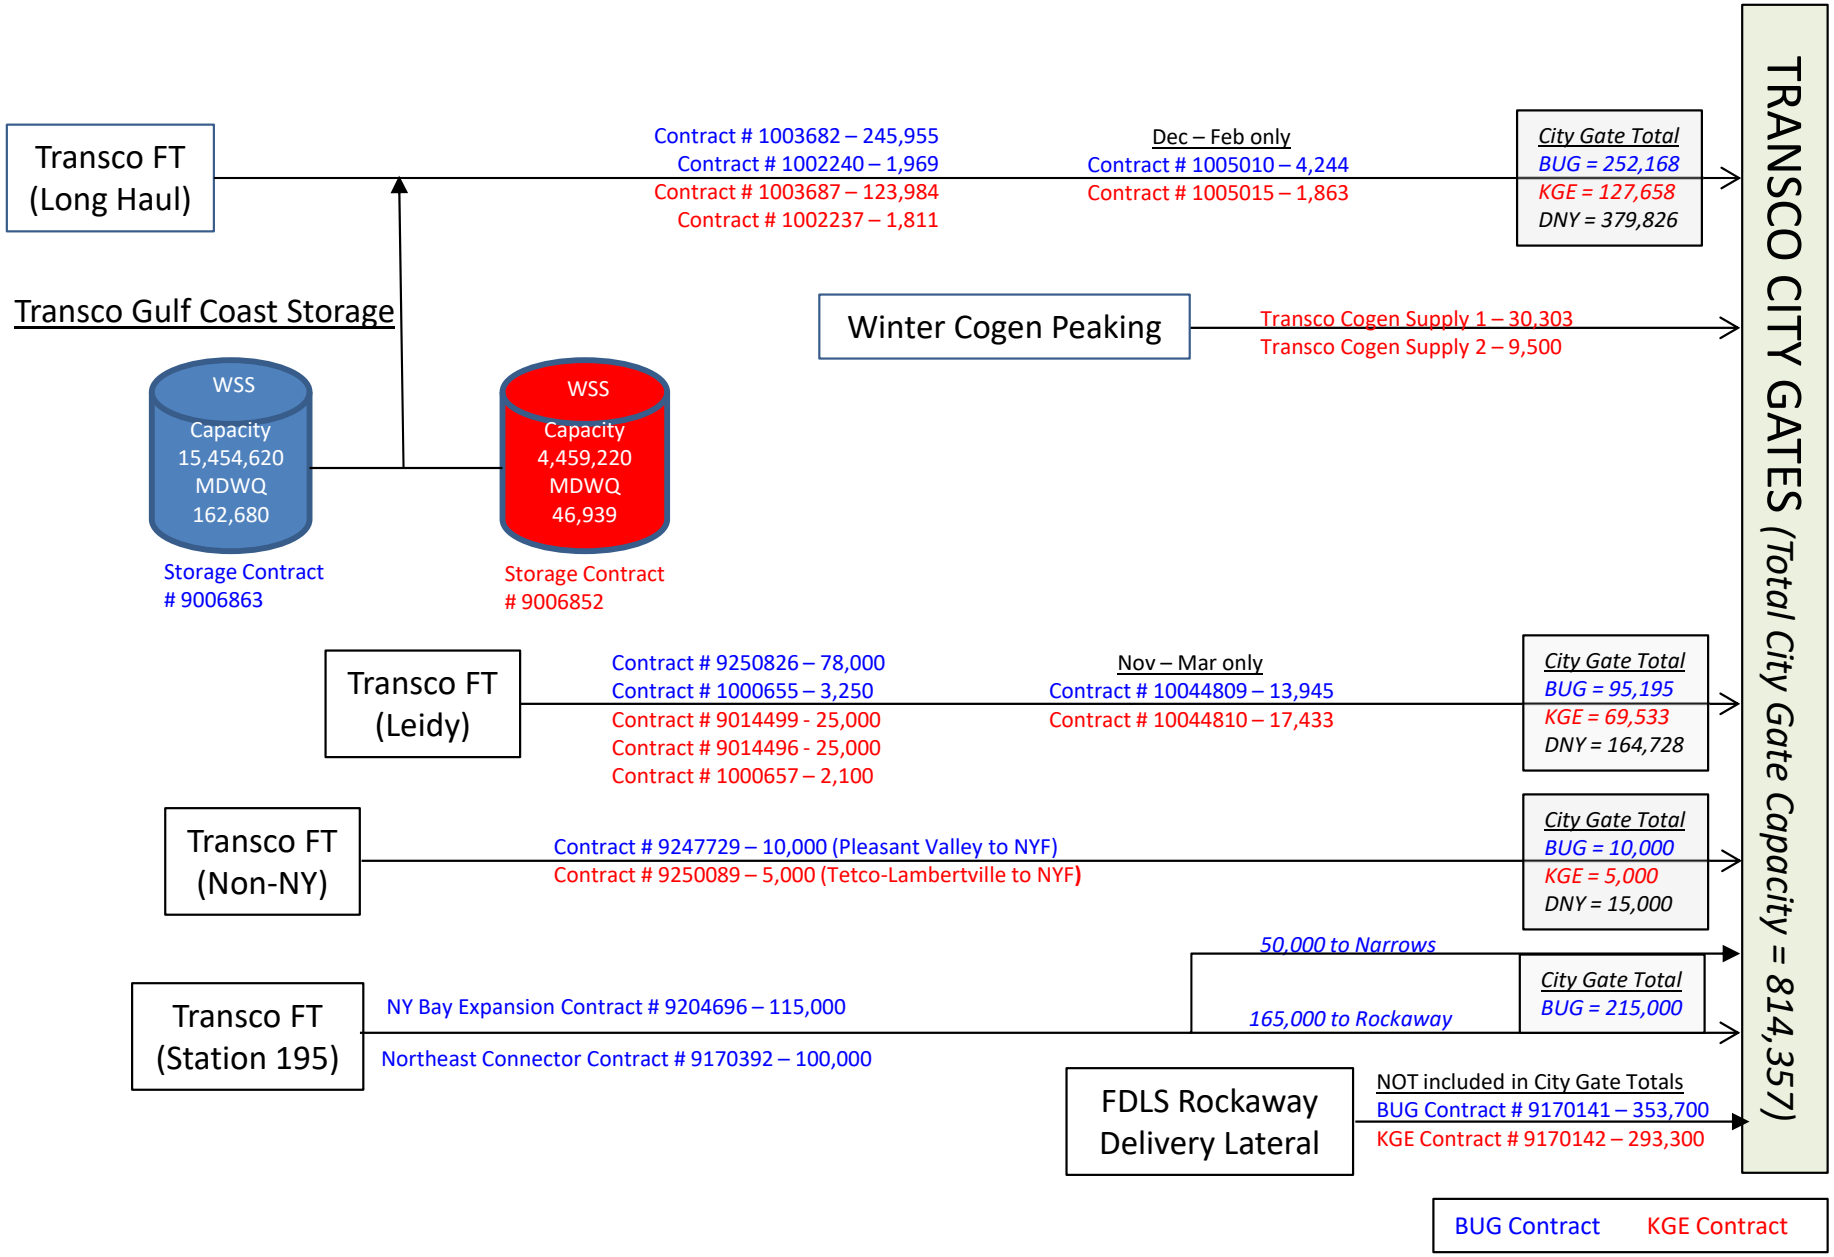

INDEX OF EXHIBITS

Exhibit ___ (GSP-8)

KEDNY & KEDLI Estimated Marginal Commodity Cost of Gas

KEDNY & KEDLI
Estimated Marginal Commodity Cost of Gas
For Period: November 1, 2024 through March 31, 2025
($ / dt)

Nov-24	Dec-24	Jan-25	Feb-25	Mar-25	Winter (Nov-Mar) Average
$ 4.99	$13.02	$22.95	$20.38	$ 9.66	$ 14.20

Exhibit ___ (GSP-9)

KEDNY & KEDLI Estimated Annualized Marginal Capacity Cost of Gas

KEDNY & KEDLI
Estimated Annualized Marginal Capacity Cost of Gas
For Period: November 1, 2024 through March 31, 2025
Units ($ per dt)

Marginal Supplies	Peak Day Quantity dt/day	Annual Capacity Costs Cost $	Quantity dt	Unitized $/dt	Peak Day Capacity Costs $/dt
30 Day City Gate Peaking Supplies	20,000	$ 2,114,200	600,000	$3.52	$105.71
121 Day City Gate Peaking Supplies	38,000	$ 5,985,000	4,598,000	$1.30	$157.50
CNG Supply Delivered via Trucks	61,600	$ 34,958,411	924,000	$37.83	$567.51
Grand Total	119,600	$ 43,057,611	6,122,000	$7.03	$360.01

Annualized Marginal Capacity Cost of Gas

Peak Day Capacity Cost	$360.01	per dt
Ratio: Peak Day Requirements to Annual Normalized Firm Sales	1 to 69	dt
Annual Marginal Capacity Cost	$5.22	per dt

Exhibit ___ (GSP-10)

KEDNY & KEDLI Non-Migration Capacity Release Revenues

KEDNY & KEDLI
Non- Migration Capacity Release Revenues
($Thousand)

	Total Margin	Customer Share	Nat Grid Share
FY 23 (as of DEC 2022)	$11,434	$9,719	$1,715
FY 22	$12,165	$10,340	$1,825
FY 21	$4,729	$4,019	$709
