STATE OF NEW YORK
PUBLIC SERVICE COMMISSION

Proceeding on Motion of the Commission as to the Rates, Charges, Rules and Regulations of The Brooklyn Union Gas Company d/b/a National Grid NY for Gas Service	**Case 19-G-0309**
Proceeding on Motion of the Commission as to the Rates, Charges, Rules and Regulations of KeySpan Gas East Corp. d/b/a Brooklyn Union of L.I. for Gas Service	**Case 19-G-0310**

Prepared Direct Testimony of:

New York City Low Income Panel:

Nicholas Patané
Christine D'Onofrio
Natasha Godby

On Behalf of:

The City of New York

August 30, 2019

INTRODUCTION

Q. PLEASE STATE YOUR NAME, OCCUPATION, AND BUSINESS ADDRESS.

A. Mr. Patané – My name is Nicholas Patané. I am an Energy Policy Advisor in the New York City Mayor's Office of Resilience and Mayor's Office of Sustainability. My business address is 253 Broadway, 14th Floor, New York, New York.

Ms. Godby – My name is Natasha Le Godby. I am an Acting Deputy Commissioner for Emergency and Intervention Services for the New York City Human Resources Administration, or HRA. My business address is 150 Greenwich Street, New York, New York.

Ms. D'Onofrio – My name is Christine D'Onofrio. I am the Director of Poverty Research for the New York City Center for Economic Opportunity. My business address is 253 Broadway, 10th Floor, New York, New York.

Q. ON WHOSE BEHALF ARE YOU SUBMITTING THIS TESTIMONY?

A. The City of New York.

Q. PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND.

A. Mr. Patané – I received a Bachelor's Degree in finance from Georgetown University in 2012 and a Master's Degree in Public Affairs from Princeton University in 2018.

Ms. Godby – I received a Bachelor's Degree in Liberal Arts from CUNY John Jay College of Criminal Justice in 1997 and a Juris Doctorate Degree from the City University of New York in 2002.

Ms. D'Onofrio – I received a Master's Degree and a Ph.D in labor economics from the New School for Social Research.

Q. PLEASE DESCRIBE YOUR PROFESSIONAL EXPERIENCE AND CURRENT RESPONSIBILITIES.

A. Mr. Patané – I have worked in the Mayor's Office of Resilience and Mayor's Office of Sustainability for one year. My prior work experience includes two years as a strategist at the New York City Economic Development Corporation and two years of experience as a consultant at Accenture.

Ms. Godby – Upon graduation from law school, I commenced my professional employment as an attorney with the New York City Law Department, where I represented the City in tort actions commenced in New York State Courts. I served as Deputy Public Administrator of Kings County where I managed the estate matters of residents that died intestate. In 2009 I transferred to HRA. I have worked at HRA for 10 years in positions of increasing authority, including Deputy General Counsel, where I provided legal counsel to the Office of Child Support Services and managed attorneys appearing in New York State family court to establish and enforce support orders. I also provided legal counsel to the Investigation, Revenue and Enforcement Administration and managed attorneys appearing in third party liability actions to enforce Medicaid and public assistance liens against personal injury and estate assets of recipients of social services. Now in my present position as Acting Deputy Commissioner of Emergency and Intervention Services, my responsibilities entail managing the Home Energy Assistance Program, or HEAP,

and the Emergency Utility Intervention Program, or EUIP, serving low income New Yorkers at risk for utility disconnections.

Ms. D'Onofrio – I have worked in the Mayor's Office for Economic Opportunity for 11 years. Much of my work involves continuing improvement of the New York City poverty measure, testing the impact of new policies such as the minimum wage or child tax credits on the poverty rate, and advising on the use of this data by multiple agencies. I was instrumental in developing a model that was subsequently adopted by the U.S. Census Bureau as the base for the U.S. Supplemental Poverty Measure. I began my work with the Poverty Research Unit developing a model to simulate tax burden and tax credits using census households as the base population. I have had positions with increasing responsibility and presently am Director of the Poverty Research Unit.

Previously, I was a Senior Legislative Research Analyst for the New York City Council, Division of Finance for over six years. I was responsible for forecasting income tax revenues and modeling the impact of tax changes on families. This work required depth of knowledge about the national and New York City macro economy, income distribution, incidence of taxation and issues of tax equity in the federal, state, and city tax codes. I also was responsible for modeling proposed changes to the City tax code, and I developed the model for the New York City Earned Income Tax Credit. I was part of the team that developed a model to estimate the impact on the city economy and city tax revenues after the World Trade Center attacks in 2001.

I also am a part-time faculty member at the School of Public Engagement at the New School, where I lecture on poverty and the family. I frequently present the results of our poverty research to communities of interest, government agencies, and in academic settings.

Q. HAVE YOU EVER TESTIFIED BEFORE ANY AGENCY OR COURT OR IN ANY OTHER VENUE ON THE TOPICS YOU ADDRESS IN THIS TESTIMONY?

A. Mr. Patané – I previously testified before the Public Service Commission, or Commission, in Cases 19-E-0065 and 19-G-0066, the Consolidated Edison Company of New York, Inc., or Con Edison, rate cases, on behalf of the City. My testimony in those cases similarly focused on low income issues.

Ms. D'Onofrio – I likewise testified in the Con Edison rate cases on behalf of the City.

Ms. Godby - I also testified in the Con Edison rate cases on behalf of the City.

PURPOSE OF TESTIMONY

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. Our testimony examines the issue of energy cost burden in New York City, and the estimated effects on affordability of an increase in rates proposed by the Brooklyn Union Gas Company d/b/a National Grid NY, or KEDNY, and KeySpan Gas East Corp. d/b/a National Grid, or KEDLI. KEDNY and KEDLI are occasionally referenced in this testimony as National Grid or the Companies. Specifically, we recommend that KEDNY and KEDLI increase the bill discount

amounts provided to low income customers as part of their Energy Affordability Program, or EAP, to reduce the cost burden of New York City's low income residents and realize the State's energy affordability targets. We also offer recommendations on KEDNY's gas service reconnection fees, and on National Grid's existing file-matching program with HRA.

Q. ARE YOU SPONSORING ANY EXHIBITS WITH YOUR TESTIMONY?

A. Yes. We offer Exhibit__(LIP-1), which is a compilation of the discovery responses from the Companies that we relied upon in preparing our testimony, some which we expressly reference herein.

Exhibit__(LIP-2) shows the Federal and State poverty thresholds we utilized as part of our energy cost burden analysis.

Exhibit__(LIP-3) shows the results of our energy and gas cost burden analysis.

Exhibit__(LIP-4) is the City's modifications to the National Grid Low Income Workbooks, which were provided by the Companies as Attachment 1 and Attachment 2 to their response to City Interrogatory Request ("IR") 79.

Exhibit__(LIP-5) shows our estimates of the potential bill impacts to other customers if our recommendations for increased low income discounts are adopted.

HRA AND UTILITY LOW INCOME PROGRAMS

Q. WHAT DOES HRA DO?

A. HRA/Department of Social Services is the nation's largest social services agency dedicated to fighting poverty and income inequality by providing New Yorkers in need with essential benefits. HRA serves more than three million New Yorkers

through diverse programs and services such as emergency rental and utility assistance, cash assistance, public health insurance, job placement and training, and emergency/ongoing food assistance, shelter, and housing subsidies.

Q. WHAT TYPE OF ENERGY ASSISTANCE DOES HRA PROVIDE?

A. HRA administers benefits through HEAP, and assists low income homeowners and renters in paying bills for electricity, heating fuel, energy equipment, and related repairs and replacements. HEAP is a federally funded program that provides eligible households with grants to pay regular and emergency energy costs for heating and cooling.

HRA also administers the EUIP, which assists individuals and families who are elderly, blind, disabled, mentally impaired, and/or residing in a neglected or hazardous environment who require financial assistance for their energy bills, primarily in cases where customers are faced with termination of services due to nonpayment, theft of service, or meter tampering. The program also responds to emergencies where the individual is at risk for termination of services and life sustaining medical equipment is present in the household. EUIP is a state-mandated program, and HRA is the designated liaison between these individuals and families and the utility companies.

Q. DOES NATIONAL GRID PROVIDE ANY FUNDING FOR THE HEAP OR EUIP PROGRAMS?

A. No.

Q. DOES NATIONAL GRID ASSIST HRA IN ADMINISTERING THE HEAP OR EUIP PROGRAMS?

A. No, but the Companies provide referrals to HRA and notify HRA of situations covered by the EUIP.

LOW INCOME PROGRAM STRUCTURE

Q. ARE YOU GENERALLY FAMILIAR WITH THE TIERED STRUCTURE OF NATIONAL GRID'S LOW INCOME PROGRAMS?

A. Yes. We understand that Tier 1 includes National Grid customers who receive assistance from HRA, and Tiers 2 and 3 include National Grid customers who receive one or two HEAP adders. Tier 4 includes National Grid customers whose utility bills are paid via direct vouchers by HRA, or for whom HRA guarantees payment to the Companies. The Companies also currently have a Tier 5 for KEDLI, and Tiers 5 and 6 for KEDNY, which they propose to fold into each utility's respective Tier 1 category. We also understand that these tiers were established by the Commission over the objections and concerns expressed by the City and others.

Q. DO YOU HAVE ANY CONCERNS WITH THIS PROGRAM STRUCTURE?

A. Yes. The program structure was designed to achieve an energy cost burden of no more than six percent of a customer's income. Based on the analysis we performed, we can now demonstrate that the program structure falls far short of achieving that goal. Additionally, it is our understanding that the analysis upon which the current program structure was based assumes a family of two persons earning at the

maximum threshold 60 percent of state median income, or 60 SMI. However, many low income customers have earnings below that level, meaning they require more assistance in order to remain within the energy cost burden threshold of six percent of total income spent on energy. The analysis also appears to assume that every low income customer receives a full HEAP discount, and that each such customer pays out-of-pocket for heat. However, HEAP funding each year is finite, and not every eligible person receives a full, or partial, HEAP payment. As discussed below, many low income customers in New York City also do not pay directly for heat and do not receive full HEAP benefits. Further, the receipt of one or two HEAP adders can be unrelated to need, and the tiered approach based on receipt of HEAP adders is unlikely to provide the most assistance to the people with the highest level of need.

Q. WHAT DO YOU RECOMMEND?

A. We strongly urge the Public Service Commission to revisit the low income program structure and revise it to better help achieve its goal of limiting the energy cost burdens of all New Yorkers to six percent of their total income.

ENERGY COST BURDEN ANALYSIS

Q. HAS THE PANEL PERFORMED AN ANALYSIS OF THE ENERGY COST BURDEN ON UTILITY CUSTOMERS WITHIN NEW YORK CITY?

A. Yes. We have performed an analysis of the energy cost burden on customers whose income falls below certain levels. Our analysis and conclusions are summarized in Exhibit__(LIP-1).

Q. PLEASE DESCRIBE YOUR ENERGY COST BURDEN ANALYSIS.

A. We performed a quantitative analysis of the economic burden placed on families from their electric and gas utility bills, with a particular focus on low income New York City residents. We compared data on actual energy cost burdens to the policy the Commission set on page 3 of its May 20, 2016 *Order Adopting Low Income Program Modifications and Directing Utility Filings* in Case 14-M-0565, or Low Income Order, that "an energy burden at or below six percent of household income shall be the target level for all 2.3 million low income households in New York." That is, New Yorkers should pay no more than six percent of their household income for utility expenses. Additionally, based on the Commission's guidance that gas bills should account for no more than half of utility burden, we compared gas costs against a three percent affordability threshold to understand how gas bills impact energy cost burden.[1] We are using the results from that analysis to support our proposal to provide more assistance to those families in New York City whose energy burdens exceed – in some cases significantly – the Commission's affordability targets.

Q. WHO PERFORMED THE ANALYSIS?

[1] *See* Low Income Order at 23 ("Gas service (whether designated as heating or non-heating) is discounted to one-half of a customer's total home energy burden.").

A. Mr. Patané and Ms. D'Onofrio performed the analysis with assistance from others within the New York City Mayor's Office of Sustainability and the Mayor's Office of Economic Opportunity.

Q. ON WHAT DATA IS THE ANALYSIS BASED?

A. The analysis started with the publicly available 2017 Public Use Micro Sample, which is part of the American Community Survey, or ACS. The survey is conducted by the U.S. Census Bureau on an ongoing basis and asks a representative sample of Americans questions related to income, housing, and other topics. The ACS is designed to provide measures of socioeconomic conditions on an annual basis for states and larger localities. It offers a statistically representative sample for New York City. As discussed in its general handbook, the ACS uses a weighting method to ensure that its estimates are consistent with official Census Bureau population estimates by age, sex, race, and Hispanic origin, as well as estimates of total housing units.

The ACS is a standard tool for measuring need. According to the Census Bureau, information from the ACS generates data that helps determine how more than $675 billion in federal and state funds are distributed each year. In questions related to housing, the ACS asks respondents to report the cost incurred for electricity and gas in the previous month and the cost incurred for fuel oil or kerosene in the past 12 months. Because costs are reported as incurred, they are presumed to be net of any direct utility discounts. Also reported in the ACS is

income from wages, transfer payments, self-employment, retirement income, and investment.

Q. HOW DID YOU DEFINE THE TERM "ENERGY COST BURDEN" FOR PURPOSES OF YOUR ANALYSIS?

A. For our analysis, we defined energy cost burden as the sum of (1) reported out-of-pocket monthly natural gas expenses multiplied by 12 plus (2) reported out-of-pocket monthly electricity expenses multiplied by 12 plus (3) reported annual other energy expenses, such as fuel oil or kerosene purchases, minus an estimated HEAP benefit, divided by annual pre-tax income. Tax credits and non-cash subsidies are not included in the income calculation. A family is determined to be energy cost burdened if its energy cost burden is greater than six percent. Six percent is both the State target and a target level used by energy affordability experts, including, for example, Fisher, Sheehan & Colton Public Finance and General Economics, who report a Home Energy Affordability Gap and whose work was relied upon by Department Staff and the Commission in establishing the State's target.

Q. HOW DID YOU DEFINE THE TERM "GAS COST BURDEN" FOR PURPOSES OF YOUR ANALYSIS?

We defined gas cost burden as reported out-of-pocket monthly gas expenses multiplied by 12 minus a HEAP estimate divided by the same pre-tax income used for energy cost burden. A family is considered gas cost burdened if their gas cost burden exceeds three percent (half of the total electric plus gas affordability

target). This is in line with the guidance established by the Commission for implementing the low income utility discounts.

Q. PLEASE DESCRIBE YOUR METHODOLOGY FOR CALCULATING A HEAP ESTIMATE.

A. To calculate a HEAP estimate, we took the average New York City non-emergency HEAP benefit paid for the 2017 federal fiscal year, as reported in the New York State Office of Temporary and Disability Assistance's Temporary and Disability Assistance Statistics released in September 2017. This yields an average HEAP benefit of $46.50. This comparatively low amount reflects the fact that most NYC residents do not receive a full HEAP benefit because many are renters and do not directly pay for their heating bills. We deducted this HEAP estimate from both gas heat and gas non-heat customers; however, we believe this to be a conservative approach that underestimates energy cost burden and gas cost burden for gas heat customers. Since gas non-heat customers typically receive their HEAP benefit directly, we adjust reported gas expenses to reflect this unreported HEAP benefit. However, gas heat customers who are eligible for HEAP typically have their HEAP benefit paid directly to the utility who applies the discount to their bills. Therefore, the gas heat bills reported to the ACS would likely already reflect the HEAP deduction.

By deducting an additional $46.50 from gas heat customers' annual bills, we are likely inflating the amount of HEAP benefits they receive since their reported annual bills should already be net of the full HEAP benefit they receive

which is typically over $300. However, we applied the average HEAP benefit to all customers as a conservative estimate.

Q. HOW DO YOU DETERMINE WHETHER A CUSTOMER IS GAS HEAT OR GAS NON-HEAT?

A. The ACS data collects information on household gas expenses, but does not distinguish the use of that gas. Therefore, to approximate whether a customer is a gas heat or a gas non-heat customer, we applied a monthly bill threshold, above which a customer is likely a gas heat customer and below which a customer is likely a gas non-heat customer. To do this, we created a histogram of reported utility bills and identified that a cutoff of $40 most accurately reflects the number of heat versus non-heat customers reported in KEDNY Exhibit__(RDP-2CU) (this exhibit does not distinguish between low-income and other customers). We believe this is a reasonable cutoff. For a KEDNY residential heating customer to pay a total bill of $40 per month, under National Grid's proposed rates, the customer would have to use only 10 therms per month. This usage level is eight times below average, suggesting that not many residential heating customers are paying bills this low. Similarly, the average KEDNY residential non-heat customer uses 10 therms per month for a projected total bill of $41.69 under proposed rates, which adds additional credence to our cutoff.[2]

[2] *See* KEDNY Exhibit___(RDP-4CU), Schedule 4, pp. 1, 2.

Q. WHAT THRESHOLDS DID YOU USE IN THE ANALYSIS TO CONSIDER A FAMILY AS "LOW INCOME?"

A. We use a threshold of 60 percent of State median income, or 60 SMI, to determine whether a family is low income. 60 SMI is the maximum income eligibility for HEAP, which is the assistance program with the highest income cutoff that enables participation in National Grid's low income programs, and is also the income threshold utilized in the Low Income Order. Low income thresholds, but not National Grid's low income programs, are adjusted for family size.

The thresholds used for SMI are included in Exhibit__(LIP-2). The Federal thresholds identified in the Exhibit are as reported by the Federal Department of Health and Human Services. State thresholds are those used for the 2016-2017 HEAP season. All thresholds used are those from the same year in which the ACS data was reported, thus corresponding to economic conditions and costs in the year the survey was conducted.

The analysis is conducted at the family level. A family is defined as a resource sharing unit composed of related individuals and domestic partners. This is different from a household, since multiple families, subfamilies, or unrelated individuals may reside in the same apartment, home, or other housing unit. Families within a housing unit are defined using the methodology the Mayor's Office of Economic Opportunity developed for the New York City poverty measure using guidelines the National Academy of Sciences suggests, and

comparable to the method the U.S. Census Bureau uses in estimating their Supplemental Poverty Measure.

Q. WHY WAS THE ANALYSIS PERFORMED AT THE FAMILY LEVEL?

A. Poverty levels are defined based on family size and income, not household income. Therefore, to properly evaluate energy costs against the low income thresholds noted in Exhibit__(LIP-2), the family units created for the New York City poverty measure are used. We note that this differs from the Commission's usage of households to determine energy cost burden. In our analysis, more than one family unit in a household would mean that we identify in the census data more than one "resource sharing unit" in that household. For example, a group of family members plus an unrelated couple who are identified as boarders would be considered two families under our analysis, and utility costs would apportioned out to each family according to size. In other words, when there are multiple families in a household, our analysis would show that each is paying less in costs than the combined household and those costs are held relative to each family's income to determine their cost burden. Our understanding is that the vast majority of households in the New York City are single-family households, and so we expect the implication of performing our analysis at the family level (as opposed to the household level) to be minor.

Q. PLEASE EXPLAIN HOW YOU DEFINE THE NATIONAL GRID SERVICE TERRITORY?

A. Our analysis focuses only on New York City customers. For our analysis, we only use responses from respondents living in Staten Island, Brooklyn, and all Queens Community Districts, except Districts 1, 2, 7, 8, and 11, which are assumed to be Con Edison gas customers. Community districts are the most granular geographic division we can make that balances available information with the need for sufficient responses for statistical significance.

We understand that, by only using this subset of data, we essentially are limiting our analysis to the KEDNY service territory, plus the Rockaways portion of the KEDLI service territory.

Q. PLEASE EXPLAIN HOW YOU DEFINE A NATIONAL GRID CUSTOMER?

A. For our analysis, respondents who live in the areas that we defined above and who report directly paying some amount greater than zero for gas are considered National Grid customers.

Q. WHAT DOES THE PANEL MEAN BY DIRECTLY PAYING FOR UTILITY SERVICE?

A. Within New York City, many families with income levels below 60 SMI live in apartment houses or other dwellings in which heat or heat and electricity are provided by the landlord. This includes master-metered buildings. The utility costs for these families may be included in their rent payments or in bills issued by their landlords rather than by Con Edison or National Grid. The numbers presented in our analysis are for families who pay some amount greater than $0

for utility bills. We were not able to differentiate whether those bills are paid directly to Con Edison and National Grid or to some other party, such as energy service companies. Similarly, directly paying for gas implies that the family is paying some amount greater than $0 for gas bills.

Q. PLEASE EXPLAIN THE PROCESS FOR CALCULATING ENERGY COST BURDEN AND GAS COST BURDEN.

A. Our analysis was conducted in R. R is a programming language for statistical computing and data visualization supported by the R Foundation for Statistical Computing. First, we cleaned the data to eliminate group quarters and responses from outside New York City from the base population, and superimposed family units on the census households. Group quarters include facilities like prisons, college dorms, nursing homes, and homeless shelters where costs are typically shared over the institution and are not billed directly to tenants or residents.

Next, we created variables to represent annual utility expenses. For fuel oil, the number reported in the ACS is already annualized. For electric and gas, we multiplied the recorded response by 12.

We then sorted families into income bands, by comparing family income against different income ranges. We then created a variable for all utilities, which is the sum of these values, minus a HEAP estimate. The HEAP estimate we used is the average non-emergency benefit paid to New York City residents in the 2017 HEAP season, or $46.50. Then, we created a variable called “utility burden” which divides the sum of all utilities minus the HEAP estimate, by pre-tax income

for each family. If that ratio is greater than six percent, the family is considered energy cost burdened. Similarly, we created a variable called "gas burden" which is the annualized gas costs minus the estimated HEAP benefit, divided by pre-tax income. If that ratio is greater than three percent, the family is considered gas cost burdened.

Next we applied filters that restrict the data set to National Grid customers. First, we identified respondents whose reported natural gas bill greater than $0. Then we identified respondents who live in the National Grid service territory, as described above.

Following this step, we applied a set of gas discounts and cost increases that reflect hypothetical discount scenarios, and estimated bill increases from the pending rate case. We did this by adding the annualized gas increase or decrease to the annualized gas bill and recalculating whether the gas cost burden is over three percent.

Finally, we generated tables for gas heat and gas non-heat customers that show the different impacts of the hypothetical cost increases or decreases and how these scenarios change the number of families that are gas cost burdened using the 60 SMI threshold.

Q. WHAT ARE YOUR FINDINGS?

A. Schedule 1 of Exhibit__(LIP-3) shows the existing energy and gas cost burden and how the 2017 low income energy cost burden landscape would change under various adjustments to low income customers' utility bills. There are six tables in

Schedule 1. Each table has a similar structure but represents a different look at the data. Table 1 looks at energy burden for all customers. Table 2 looks at gas burden for all customers. Table 3 looks at energy cost burden for non-heat gas customers. Table 4 looks at gas cost burden for non-heat gas customers. Table 5 looks at energy cost burden for heating gas customers. Table 6 looks at gas cost burden for heating gas customers.

As shown in Table 1 of Schedule 1 of Exhibit__(LIP-3), in the National Grid service territory, there are 220,470 families living under 60 SMI who pay more than six percent of their income toward their energy bills. This number represents 18 percent of all customers in the National Grid service territory and 55 percent of all National Grid customers under 60 SMI. Additionally, in the National Grid service territory, there are 148,168 families living under 60 SMI who pay more than three percent of their income toward their gas bills (Table 2). This number represents 12 percent of all customers in the National Grid service territory and 37 percent of all customers in the National Grid service territory under 60 SMI. These results demonstrate that National Grid's existing low income discounts are not sufficient to satisfy the Commission's goal that no low income customer pays more than six percent of income to energy costs, or more than three percent of income to gas costs.

We also found that gas cost burden disproportionately impacts low income families. Only 33 percent of all customers in the National Grid service territory have income levels under 60 SMI, but low income customers represent 68 percent

of gas cost burdened families. Put another way, 37 percent of all low income families are gas cost burdened; in contrast, only 9 percent of non-low-income families are gas cost burdened.

We also see that both energy and gas cost burden are more acute for gas heat customers. As seen in Table 4 of Schedule 1, 15 percent of low income non-heat gas customers are gas cost burdened, whereas over 60 percent of gas heat low income customers are gas cost burdened, as shown in Table 6 of Schedule 1. Said differently, of the 141,168 National Grid low income customers who are gas cost burdened, 22 percent are non-heat gas customers and 78 percent are gas heat customers. Looking to Tables 3 and 5, whereas 42 percent of low income gas non-heat customers are energy cost burdened, nearly 70 percent of low income gas heat customers are energy cost burdened. These findings highlight the need for greater focus on gas heat customers.

In the columns to the right in each table, we see the impacts of various hypothetical incremental discounts, that is, what happens if instead of rates increasing as proposed, monthly bills were discounted by some amount incremental to existing discounts. Looking at Table 6, we see that meeting the state target that no low income family should spend more than 3 percent of their income on gas would require significant discounts. Even with monthly discounts as high as $200 per month – which is not what we are proposing – there are still over 12,000 low income gas heat families who remain gas cost burdened (Table

6) and over 40,000 low income gas heat families who remain energy cost burdened (Table 5).

Q. WILL THE REVENUE REQUIREMENT INCREASE REQUESTED BY NATIONAL GRID IN THESE RATE CASES HAVE ANY EFFECT ON THE GAS COST BURDEN FOR LOW INCOME FAMILIES?

A. Yes. According to the Direct Testimony of National Grid's Shared Services Panel, KEDNY and KEDLI are proposing to maintain the same bill discounts that are in effect as of January 1, 2019, with the exception that Tiers 5 and 6 are being eliminated for both utilities. In other words, the available bill discounts remain the same as currently exist for all customers. However, KEDNY and KEDLI also are requesting rate increases from customers. Therefore, all low income customers participating in the Companies' low income programs would receive a proportionally lower discount than they receive now, and both gas cost burden and energy cost burden would worsen for low income customers.

Q. SHOULD THE RATES PAID BY LOW INCOME CUSTOMERS BE HELD CONSTANT AT THEIR CURRENT LEVELS?

A. No, we are not advocating that. However, by increasing gas delivery rates by 22 percent for an average residential reduced rate non-heat customer and 18 percent for an average residential reduced rate heat customer[3] while holding constant the

[3] *See* KEDNY Exhibit__(RDP-4CU), Sch. 4, pp. 3, 5.

low income discounts, low income customers will not receive the same proportionate benefit as they receive now.

Q. WHAT OTHER IMPACTS OF THE PROPOSED RATE INCREASES ON CUSTOMERS' ENERGY COST BURDENS ARE LIKELY?

A. In addition to low income customers not receiving the same proportionate benefit, the rate increase is likely to result in more customers experiencing an energy cost burden above six percent of their income and a gas cost burden above three percent.

Q. BASED ON YOUR ANALYSIS, HOW MANY MORE CUSTOMERS WILL BECOME GAS COST BURDENED AS A RESULT OF THE PROPOSED RATE INCREASES?

A. Our analysis finds that, unless the low income discounts are increased, 20,000 low income heat gas customers and 7,500 low income non-heat gas customers who are not gas cost burdened today would become gas cost burdened from the proposed rate increase.

Q. HOW DID YOU CALCULATE THIS RESULT?

A. Calculating the exact effect of the increased revenue requirement on customers' energy cost burdens is complicated by the fact that ACS does not track the energy usage of each low income family. Therefore, for the purposes of our analysis, we estimated the impact based on a typical gas non-heat customer and a typical gas heat customer.

In KEDNY Exhibit __ (RDP-4CU) Schedule 4, Pages 3 and 5 of 18, National Grid estimates an average residential KEDNY non-heat reduced rate customer would see a total bill increase of $4.82. Similarly, an average residential KEDNY heat reduced rate customer would see an average increase of $14.57. To estimate the impact of the proposed gas rate increases, we add these amounts to our analysis of gas heat and non-heat customer bills.

It should be noted that this approach will overestimate the impact on KEDLI heat customers and slightly underestimate the effect on KEDLI non-heat customers. As shown in KEDLI Exhibit__(RDP-4CU) Schedule 4, Pages 2 and 4 of 17, the average increase for a residential KEDLI reduced rate non-heat customer is $5.38, and the average increase for a residential KEDLI reduced rate heat customer is $8.49. We would have preferred to add the heat increases for KEDNY and KEDLI separately. However, we cannot maintain statistical significance by splitting KEDLI's New York City territory into a separate analysis. Given there are significantly more New York City KEDNY heat customers than New York City KEDLI heat customers, we believe using the KEDNY increases would be a reasonable approach for the majority of heat customers.

Q. PLEASE CONTINUE.

A. Based on our calculations, it appears that the proposed rate increases would have a significant negative impact on the energy cost burdens and gas cost burdens for low income New York City families. They will both increase the total number of

families that are energy cost burdened and increase the magnitude of the burden for those families who are already cost burdened.

Q. DO YOU BELIEVE THIS OUTCOME IS CONSISTENT WITH THE PUBLIC SERVICE COMMISSION'S INTENT AND GOAL IN ITS LOW INCOME ORDER IN CASE 14-M-0565?

A. No. Using the Public Service Commission's policy as guidance in this case, National Grid's proposal does not maintain the status quo; it makes the situation worse for more New York City families.

Q. BASED ON YOUR ANALYSIS, WHAT ARE YOUR RECOMMENDATIONS TO ADEQUATELY ADDRESS LOW INCOME ENERGY COST BURDEN?

A. We believe that bill discounts should be increased to reduce gas cost burdens for 50 percent of low income heat gas customers. While this is less ambitious than the current state target, we believe this would be a significant improvement over the current practice.

Q. WHAT APPROACH DID YOU USE TO CALCULATE DISCOUNTS NEEDED TO ADDRESS GAS COST BURDENS FOR HALF OF ALL LOW INCOME HEAT GAS CUSTOMERS?

A. To calculate the discounts needed to address gas cost burdens for half of all low income heat gas customers, and to remain consistent with the Generic low income order, we make adjustments to the National Grid Low Income Workbooks for KEDNY and KEDLI as shown in Exhibit__(LIP-4).

We first adjusted median incomes to reflect that the median income for New York City National Grid customers under 60 SMI and over 130 percent of the federal poverty level is $27,808 and median income for Tier 3 customers is $10,921 as found in the ACS data. This fixes a flawed assumption in the workbook structure. The original workbook bases discounts on the high end of the income threshold, that is, it assumes that all low income customers are at 60 SMI when many such customers earn less than 60 SMI. This creates an inherent assumption that many low income customers have more resources at their disposal than they actually do. Basing discounts on the highest income level will only address energy cost burden for families who make income that is equal to the high end threshold. To address gas burden for half of National Grid customers, a median income is required.

Second, we adjust the average bills used in the National Grid Low Income Workbook to reflect the proposed rate increases. Average KEDNY bills should be increased to reflect that gas heat bills would go up $14.57 for low income customers and gas non-heat bills would go up $4.82, and average KEDLI bills should be increased to reflect that KEDLI gas heat bills would go up $8.49 and KEDLI gas non-heat bills would go up $5.38 per Exhibit__(RDP-4CU).

Q. WHAT DISCOUNT LEVELS DID YOU FIND ARE NEEDED TO ADDRESS GAS COST BURDENS FOR HALF OF ALL LOW INCOME HEAT GAS CUSTOMERS?

A. Based on these changes described, we found that the resulting discounts needed to achieve energy affordability for low income customers are much higher than those currently in place. For KEDNY, the required discounts are $59 for Tiers 1, 5, and 6 (compared to $18 today), $79 for Tier 2 customers (compared to $37 today), $99 for Tier 3 customers (compared to $56 today), and $58 for Tier 4 customers (compared to $42 today). For KEDLI this amounts to $52 for Tiers 1 and 5, $72 for Tier 2 customers, $92 for Tier 3 customers, and $51 for Tier 4 customers.

Q. WHAT IS THE ESTIMATED EFFECT OF SUCH DISCOUNTS ON ENERGY COST BURDEN?

A. We estimate that the increased discounts would lift 20,000 low income New York City families out of gas cost burden. Based on our ACS analysis in Table 6 of Schedule 1 of Exhibit__(LIP-3), we found that 190,000 families are low income gas heat customers. Our proposal would solve gas burden for half of this population, *i.e.*, 95,000 families. This equates to 20,000 fewer gas cost burdened families than the 115,000 gas heat low income families who are gas burdened today under existing discounts.

Q. HAS THE COMMISSION ESTABLISHED ANY CONSTRAINTS ON THE ALLOWED SIZE OF UTILITY LOW INCOME BILL DISCOUNT PROGRAMS?

A. Yes. The Commission has placed restrictions that utility bill discounts should not exceed two percent of a utility's revenues, which includes "both total utility revenues and the commodity portion of Energy Service Company revenues

collected through consolidated utility billing to those customers."[4] KEDNY's total reported operating revenues are projected at just over $2 billion in the Rate Year, according to information taken from the Company's Rate Design Panel exhibits.[5] Therefore, that cap dictates that the maximum amount that can be spent on gas low income discounts in KEDNY's territory is approximately $41 million. Similarly, KEDLI's projected total operating revenues are over $1.25 billion in the Rate Year, and the maximum amount that can be spent on gas low income discounts in the KEDLI service territory is approximately $25 million.[6]

We recognize that the final revenue requirements approved by the Commission may be lower than the amounts the Company requested, so these amounts will need to be adjusted correspondingly.

Q. WHAT IS THE AGGREGATE COST OF IMPLEMENTING YOUR PROPOSED DISCOUNT LEVELS?

A. If these proposed needed discounts were implemented, based on anticipated customer usage in KEDNY, the total cost of the discount program would be $59 million per year. For KEDLI, the cost would be $10 million. We understand that this would exceed the threshold of two percent of operating revenues allowable for the KEDNY program; however, we believe such discounts are still justifiable.

Q. PLEASE CONTINUE.

[4] Low Income Order at 30.
[5] KEDNY Exhibit___(RDP-4CU), Sch. 2.
[6] KEDLI Exhibit__(RDP-4CU), Sch. 2.

A. In the generic low income proceeding, the Commission stated that discounts should produce no more than a ten percent energy burden, and that if the ten percent energy burden is reached, the two percent funding limit would need to be reexamined.[7] Our analysis of the ACS data shows that there are currently 145,000 low income National Grid customers who are energy cost burdened over 10 percent of their income. This represent 35 percent of all low income National Grid customers. Moreover, 100,000 low income National Grid customers pay over 5 percent of their income toward their gas bills. The majority of these customers (over 80 percent) are heating gas customers which signals a particularly acute need for relief for heating gas customers. Our analysis of extreme cost burden (*i.e.*, 5 percent gas cost burden and 10 percent energy cost burden) are shown in Schedule 2 of Exhibit__(LIP-3).

Q. IF THERE IS NO RELIEF FROM THE TWO PERCENT CAP, DO YOU HAVE ANY ALTERNATE PROPOSAL FOR DEEPENING THE DISCOUNT LEVELS?

A. Preliminarily, we believe there is strong support for deepening heat discounts as proposed above. As demonstrated by our analysis, existing discount levels fall woefully short of alleviating gas cost burdens for a significant proportion of the low income customer segment. If the Commission is to make meaningful progress towards its ultimate goal of ensuring that no low income customer in the State has

[7] Case 14-M-0565, Proceeding on Motion of the Commission to Examine Programs to Address Energy Affordability for Low Income Utility, Order Granting in Part and Denying in Part Requests for Reconsideration and Petitions for Rehearing (issued February 17, 2017), p. 21.

an energy cost burden greater than six percent (or a gas cost burden greater than three percent), the utility low income programs will have to be significantly increased, perhaps beyond the two percent cap.

That notwithstanding, if the Commission decides that KEDNY and KEDLI must adhere to two percent cap, their discounts should nonetheless be set at levels that will alleviate energy cost burden to the maximum extent possible while avoiding adverse impacts to the most cost burdened families and non-heat gas customers. To that end, as an alternative to our preferred approach, we would recommend that discounts for heating customers should be increased by $20 for all tiers.

In KEDNY, this results in discounts of $38 per month for Tiers 1, 5, and 6; $57 per month for Tier 2; $76 per month for Tier 3; and $62 per month for Tier 4. In KEDLI, this results in the same discounts, except Tier 3 KEDLI customers would receive $77 per month. These discounts would be the same even if National Grid's proposal to eliminate Tiers 5 and 6 in both service territories, and to fold those customers into Tier 1, is adopted.

To be clear, this is not the City's most preferred outcome, as many customers would remain energy cost burdened. That being said, we believe this proposal can significantly improve energy cost burden for low income National Grid customers while still adhering to the two percent cap.

Q. HOW DO THESE DISCOUNTS COMPARE TO DISCOUNTS OFFERED BY UTILITIES WITH SIMILAR CUSTOMERS?

A. Con Edison provides natural gas service to the Bronx, Manhattan, and parts of Queens. Their Low Income Workbook uses the same average monthly bill for a low income gas heat customer, $115, as what is included in KEDNY's Low Income Workbook.[8] Whereas Con Edison provides gas heat discounts of $50.00 per month across all tiers, based on the number of customers across tiers in Exhibit__ (SSP-9), 80 percent of KEDNY customers receive lower benefits than similar Con Edison customers despite having similar energy bills. Furthermore, incomes are not significantly different across service territories. The incomes used in the Con Edison and National Grid Low Income Workbooks are nearly identical, except that Tier 4 incomes in National Grid territory were $220 per year higher. This suggests that National Grid's current discounts are insufficient. Under our proposal, the discounts would be closer to what similarly situated customers in the Con Edison service territory receive.

Q. WHAT WOULD BE THE IMPACT ON OTHER CUSTOMERS OF YOUR ALTERNATE PROPOSAL?

A. Based on the information contained in the Companies' updated Gas Rate Design Panel exhibits regarding the number of customers and operating revenues per service class, we estimate that the cost of increasing low income discounts as proposed would have only a minor effect on other customers. In particular, assuming that costs of the low income programs are allocated to customer classes

[8] *See* Case 19-E-0065 *et al.*, Proceeding on Motion of the Commission as to the Rates, Charges, Rules and Regulations of Consolidated Edison Company of New York, Inc. for Electric Service, Direct Testimony of the New York City Low Income Panel, Exhibit__(LIP-5) (filed May 24, 2019).

based on operating revenues, we estimate that increasing the discounts as proposed would lead to a monthly increase of $0.28 for a KEDNY residential non-heat customer and $1.22 for a KEDNY residential heat customer. Additionally, we estimate that these discounts would increase monthly KEDLI bills by $0.11 per month for residential non-heat and $0.30 per month for residential heat customers. Our analysis of potential bill impacts on other customers is set forth in Exhibit__(LIP-5). We believe these are modest increases compared to the benefit to low income customers.

Q. ARE YOUR RECOMMENDATIONS CONSISTENT WITH THE COMMISSION'S LOW INCOME ORDER?

A. Yes. In the Low Income Order, the Commission established a default process for setting low income benefit levels that is uniform across all of the utilities. However, the Commission also specifically provided utilities with flexibility to propose alternative means to calculate discounts, so long as they demonstrably accomplished substantially the same results, and left no class of participant underserved. Our recommendations here utilize assumptions that are more indicative of actual income levels of low income households in New York City. As such, they are designed to better accomplish the Commission's policy goal that New York's low income households have an energy burden at or below six percent of household income. Moreover, because our proposed discount levels are based on actual income and energy burden data rather than on an assumption that low income customers earn the maximum threshold of 60 SMI, they would bring more

low income customers up to the Commission's targeted energy burden level of no more than six percent of income. In other words, our proposed increases to current discount levels arguably would make National Grid's EAP *more* inclusive for the thousands of low income households for whom existing discount levels are inadequate.

Q. DO YOU CONSIDER YOUR PROPOSED DISCOUNT CALCULATION METHODOLOGY TO BE A "TOP DOWN" APPROACH?

A. No. To the contrary, we consider our methodology to be a "bottom up" approach. That is, we first analyzed actual income data to develop the appropriate low income household energy burdens, and then calculated the amount of bill discounts needed to achieve an energy burden of no more than six percent of household income. We then extrapolated those increased bill discounts to determine what budgets are necessary for the Companies' respective EAPs, while still remaining within the Commission's established policy that the total budget for a utility's low income program may not exceed two percent of total operating revenues. Importantly, we did not first set each utility's program budget to the maximum two percent cap as a starting point, and then allocate dollars among the different tiers of bill discounts.

RECONNECTION FEES

Q. WHAT ARE RECONNECTION FEES?

A. Reconnection fees are charges that a customer must pay to a utility to reconnect gas service that has been discontinued for non-payment.

Q. WHAT ARE THE COMPANIES' POLICIES REGARDING

RECONNECTION FEES FOR LOW INCOME CUSTOMERS?

A. KEDNY currently charges customers a reconnection fee of $66.13 (plus reimbursement of the Company's City Marshall fees and court filing fees) if service is to be reconnected at the meter or an existing curb valve, and a reconnection fee of $300 if service is to be reconnected at the utility's main by excavation of the street. However, KEDNY also offers a one-time credit of the reconnection fee to low income customers participating in its EAP whose service was disconnected for non-payment.

KEDLI currently charges its customers a $78 reconnection fee, but waives this fee for low income customers.

Q. DO YOU RECOMMEND ANY CHANGES TO THE COMPANIES' RECONNECTION FEE PROGRAMS?

A. Yes. While we appreciate that KEDNY provides low income customers a one-time waiver of the reconnection fee, we propose that KEDNY eliminate their reconnection fees altogether for all low income customers.

Q. WHY SHOULD KEDNY ELIMINATE ITS RECONNECTION FEES FOR LOW INCOME CUSTOMERS?

A. Eliminating reconnection fees for low income customers is appropriate because it will provide them with a better opportunity to remain utility customers and pay their utility bills. In particular, low income customers who are facing termination of service already have demonstrated an inability to pay utility bills. Requiring these customers to pay a fee to reconnect their gas service detracts from the amount

they can put toward paying their past due bills, and creates an additional financial barrier for them to overcome. Customers and the utilities would be much better served if this money was instead put towards direct payment of the customers' utility bills.

Moreover, the amount collected for reconnections is very small when considered in context. According to National Grid's response to City IR-106, on average over the last five years, KEDNY collected approximately $1.3 million in reconnection fees annually from all customers. According to National Grid's response to DPS IR-260, approximately $174,000 of that amount was collected annually from low income customers over the same time period. These amounts, and in particular the amount collected from low income customers, are insignificant when considered in context of the revenue requirement increase that KEDNY is seeking in this rate case, approximately $196 million in the Rate Year. We also understand that each Company's actual annual gas revenue requirements are in the billions of dollars.

Conversely, KEDNY's reconnection fees are substantial, particularly from the perspective of a low income customer. As previously noted, KEDNY charges a reconnection fee of $66.13 (plus fees) for reconnecting service at the meter, which represents nearly 58 percent of an average KEDNY low income heating customer's monthly gas bill. Thus, in context, the loss of these reconnection revenues would be inconsequential for the Companies, but the savings could be material for a customer who already cannot afford his or her utility bill.

Finally, elimination of KEDNY's reconnection fees for low income customers is appropriate to harmonize the utility's practices with those already adopted by KEDLI. This eliminates the possibility of low income customers residing in different portions of New York City (for example, on the Rockaways versus in Brooklyn) being subject to different rules on reconnection fees.

HRA FILE MATCHING PROCESS

Q. PLEASE DESCRIBE THE EXISTING FILE MATCHING PROCESS BETWEEN HRA AND NATIONAL GRID.

A. As part of their 2016 rate cases, National Grid implemented a file matching process with HRA to identify and enroll low income customers in KEDNY's service territory, and in the Rockaways portion of KEDLI's service territory, who are eligible for the Companies' respective EAPs. HRA currently performs the matches and opt-out process between the Companies' records and its records twice a year.

Q. PLEASE DESCRIBE THE OPT-OUT PROCESS.

A. The current matching process was developed to provide notification to HRA's clients of the existence of the National Grid low income programs. Those clients who do not choose to opt out when so notified are considered to have consented to HRA providing their names and limited information necessary for their participation in the programs to National Grid to be enrolled in the low income programs. HRA does not disclose to National Grid which type of benefit(s) any of HRA's clients receive – only that they qualify to be enrolled. Every time a match

is performed, there are some HRA clients who choose to opt-out; HRA does not disclose any information regarding these clients to National Grid.

Q. HAS HRA HISTORICALLY RECEIVED FUNDING FROM NATIONAL GRID FOR ITS ADMINISTRATIVE COSTS ASSOCIATED WITH PERFORMING THE LOW INCOME PROGRAM MATCH?

A. Yes. National Grid currently reimburses HRA for the out-of-pocket costs incurred to perform the matches, up to a cap of $100,000 annually. The reimbursement amount and cap have both been approved by the Commission.

Q. WHAT DO THE COMPANIES PROPOSE IN THIS RATE CASE?

A. The Companies do not propose any changes to both the existing file matching process and the reimbursement mechanism.

Q. WHAT IS YOUR RECOMMENDATION REGARDING THE HRA FILE MATCHING PROCESS?

A. The file matching process and reimbursement mechanism have worked well over the last few years. It is a valuable activity that helps ensure that the City's neediest residents receive additional assistance in paying their utility bills. As such, we recommend that the HRA file matching process and reimbursement mechanism continue, with some modifications. Specifically, we recommend increasing the frequency of the file match, and commensurately increasing the reimbursement cap.

Q. WHAT CAPACITY DOES HRA HAVE TO INCREASE THE NUMBER OF MATCHES PERFORMED EACH YEAR?

A. HRA could increase the match frequency from twice a year to four times a year, or quarterly.

Q. WHAT BENEFITS DO THE PANEL ANTICIPATE AS A RESULT OF MORE FREQUENT MATCHES?

A. We believe that performing the match twice as often will improve the accuracy of customer enrollment in the Companies' low income programs. Performing the match more frequently also will help ensure that customers who are newly-qualified for the Companies' low income programs are properly enrolled and receive the utility low income discount sooner.

While we considered other possible frequencies of the matching process, we believe that a quarterly match strikes a fair and reasonable balance between the desire to continue improving the accuracy and scope of the Companies' low income programs, with the administrative costs and resources that would be required of HRA to perform the matches more than four times a year.

Q. DOES THE PANEL BELIEVE THAT MORE FREQUENT MATCHES WILL INCREASE THE NUMBER OF CUSTOMERS ENROLLED IN THE COMPANY'S LOW INCOME PROGRAMS?

A. Possibly. As stated above, more frequent matches will provide greater opportunities for eligible persons to participate in the Companies' low income programs. However, more frequent matches may not necessarily equate to a sizable increase in participation levels. This is due to perpetual movement of individuals and families coming on and off assistance benefits based on eligibility.

We will not know the exact impact more frequent matches would have on program enrollment until HRA does a full year of quarterly matches.

Q. WHAT IS YOUR PROPOSAL FOR REIMBURSEMENT LEVELS FOR HRA TO PERFORM QUARTERLY MATCHES?

A. As HRA will be performing the match twice as often as it does currently, we recommend that the reimbursement cap be increased by an additional $100,000 per year – for a total of $200,000 per year – to enable HRA to perform a quarterly match.

Q. WHAT IS INCLUDED IN HRA'S ADMINISTRATIVE COSTS RELATED TO PERFORMING THE LOW INCOME MATCH?

A. HRA's administrative costs include the cost of the opt-out process, including the cost of preparing and issuing the letters, envelopes, postage, and computer time to perform the matches. As in any organization, there is a cost associated with each program run on the central processing unit.

Q. WHAT COSTS ARE NOT INCLUDED IN HRA'S REQUEST FOR REIMBURSEMENT?

A. HRA dedicates many hours of its employees' time to this effort. Its employees must refine the programming language, run the match, perform quality control, oversee the mailing process, monitor and catalogue returned mail, respond to questions from clients, process the responses received, and interact with National Grid. This effort also requires management oversight and administrative support.

This time is taken away from these employees' primary job duties and responsibilities to HRA's programs.

HRA continues to be willing to contribute its employees' time for more frequent matches because of the value provided by the National Grid low income programs to its clients. While we have not calculated the total cost being absorbed by HRA to perform quarterly matches, it is likely well in excess of the amount for which reimbursement is sought.

Q. CAN HRA ALLOCATE CITY FUNDS TO THIS EFFORT?

A. No. HRA's role is to administer its own low income programs, not utility low income programs. HRA's funding, whether from federal or state sources, or through the City's budget process, is intended and budgeted to support its own programs. Use of the funds must relate to the programs for which they are allocated. For example, funds for the Supplemental Nutrition Assistance Program could not be used to provide energy-related benefits. For these reasons, HRA does not have any funding available to support National Grid's low income programs.

Q. COULD HRA DELEGATE TO NATIONAL GRID THE RESPONSIBILITY TO CONTACT HRA CLIENTS AND PERFORM THE OPT-OUT STEP OF THE PROCESS TO REDUCE COSTS?

A. No. As established in Case 14-M-0565, information regarding HRA's clients is confidential as a matter of law. Under Federal, State, and local law, there are strict limitations on the information HRA may disclose to a third party about its clients beyond that which is already being provided to National Grid, namely, an indication

of eligibility for the low income program. HRA therefore could not share the preliminary results of the matches with National Grid or have them ask such clients whether they want their information conveyed to the Companies. And, as noted above, at no time does HRA disclose to National Grid which type of benefit(s) any of HRA's clients receive – only that they qualify to be enrolled. If an HRA client opts-out, HRA does not disclose that client's information to National Grid.

Q. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes.
